jimomura@lsuc.on.ca (Jim Omura) writes:

- That's not to say that it's impossible to create a great
- picture with Degas, for an artist you're working against the program
- rather than with it. It's like this: You're standing in front of
- your canvas with your "assistant" sitting beside you. Every time
- you want to change colours on your brush or think about picking up
- a different brush, he throws a blanket over your picture. . . .

A real artist must look down to his palette to change colors, right? So he's not always looking at his canvas. :^) Anyways, wouldn't a real artist have the image in his mind, so putting a blanket over the image wouldn't be so bad? Dunno. Like I said, I'm not a real artist. :^)

- Then again there was the disappearing cursors. That was another
- "classic feature" of Degas. Degas was a "passable" program at a
- time when the only other program on the market was Neochrome. I
- hated Neochrome even worse, though thankfully, it's been so long
- since I used it that I've actually forgotten exactly what it was
- I didn't like about it. Hey Neato!!! A bad memory has its
- compensations! :-)

Perhaps I should have been more specific to say "Degas Elite" instead of Degas. I've never used Degas. It was a mistake to bundle the two together.

- Anyway, CyberPaint is the best program I've tried on the
- ST so far in this regard. Deluxe Paint may be better, but I
- haven't gotten around to trying it yet.

I never regarded CyberPaint as a paint program, but more of a tool for animations. Now that you mention it, I guess it could be used as a paint program.

- With CyberPaint you don't "hold down the right button." You
- just click it to bring the menu bar up and click again to get rid of
- it. This is the best user interface for artwork that I've seen
- so far -- as I've said before.

Have you used any of the paint programs on the Mac? Pixel Paint Professional is one I like (but it's on the Mac :^( ). It has many features that aren't on other programs, but like other drawing programs for the Mac your image is always on the screen, and you just change your tool or select your color by selecting one of the icons on the left. Or another way would be to have two screens, like with the Lumena, ArtStar, or Dubnar systems; one screen is for the commands and

the other is for the image. Finally, TIPS and RIO also implement a nice interface with a menu that appears up over the image when you press the right mouse button or the stylus button.

- In fact, it's so good that I obtained Jim Kent's permission to copy
- the whole CyberPaint user interface for a paint program on another
- computer. That's an interesting story. I actually finished that
- program and it works. Jim Kent has a copy of it. Unfortunately, the
- computer I wrote it for was marginally popular and the negotiations
- for the distribution of the program died. 9 months of work went down
- the drain. Life'ls like that. . . .

Zoetrope on the Amiga seems to be exactly like CyberPaint. It was strange seeing it on an Amiga.

- On the one hand you say you've used lots of paint programs.
- Yet you obviously don't know how CyberPaint works.

Well, I know how CyberPaint works. It's just that I never thought of it as a drawing program, but more of a coloring utility for animations. This discussion started about using the right mouse button in programs to bring up a menubar and just noted Degas as an example -- not that it was the premier drawing program. I guess it got a little out of hand. :^)

5. how can I print to disk?

Newsgroup: comp.sys.atari.st
Date: 1991-01-01 11:37:18 UTC
From: russ@wpg.com
Message-ID: <3507@wpg.com>
Source record: 236164

Are there any binaries available that will capture data headed
for the printer port and re-route it to a file? I've got an
ST that a friend of mine wants to use for wordprocessing, but
she'd prefer to send the output files to a highspeed laser on
one of our unix systems, rather than print her documents on
the cheapie printer attached to the ST.

Someone suggested barrel.prg a few weeks ago, but the copy I
found on compuserve provides spooling to ram only, rather than
to disk.

Well you can't just put Normal programs into a E-Prom, as most programs would need some ram to work with, also the Rom Code would not be relocatable, but then the Rom code could be copied to Ram, but what would be the piont of this, most program would encase the ram needed within its self, this would not work with Rom programs...

I am looking for ANSI Terminal Emulator source code for the Atari ST.
If you have source code for one, or VT100, PLEASE send it to me. Also, if
you dont have the source code, but do have a text file that contains the
needed info to make my own, please let me have a look at it.

Thanks in advance!!

.5..11.1.. 6 4.2 Xevious

In this list, games have been rated on a scale of 1 to 10, 10 being the best and 1 being the worst. For each game, the total number of votes, the average rating, and the vote distribution are shown. New games are indicated by a "*" before their entry. If a "(C)" appears after the title it means that the game is a CD-ROM or disc system title. If a "(J)" appears after the title it means that the game is currently only available in Japan.

The general guideline for ratings is:

8-10 worth buying at full price
6-7 worth buying at a discount, or if you're particularly interested in this kind of game
3-5 only worth renting
2 only worth playing for free, and only for a few minutes
1 worthless

The vote distribution uses a single character to represent the percentage of votes for each ranking. The following character codes can appear:

"." no votes cast "3" 30-39% of the votes "7" 70-79% of the votes
"0" 1-9% of the votes "4" 40-49% of the votes "8" 80-89% of the votes
"1" 10-19% of the votes "5" 50-59% of the votes "9" 90-99% of the votes
"2" 20-29% of the votes "6" 60-69% of the votes "*" 100% of the votes

Please consult the article entitled "ABOUT THE VIDEO GAME RATINGS REPORT" in the newsgroup rec.games.video for more details, including information on how to vote.

Questions, comments, problems, and errors should be directed to the list maintainer at either of the below addresses:

>seems a little more realistic, and it would only work on a 2000 or 3000,
>not a 500. Did the AmigaWorld article say which models it worked on?i

No, it did't say. I imagine MAST's board is just a place to plug
in ROMs & whatever custom stuff is needed to emulate an ST. Wouldn't be
surprised if it sits in the 68000 socket with the 68K plugged into the
emulator board.
There's another I've heard of, which may be one you're talking about,
called Medusa. I beleive it's an actual Zorro II (the bus on the 2000) card,
so it won't plug into a 500.

>You say the article stated that text speed was 120% of an ST and disk I/O
>108% of an ST. I would be curious to know how the numbers would compare
>if you used one of the inexpensive 'software blitters' like Quick ST or
>Turbo ST and used disks with a 'twisted' sector skew in the tests. Many,
>if not most ST users do these things and thus increase their performance
>greatly without spending much. I'd be curious whether you could do this
>on the emulator and how it would compare to an ST then.

The claimed speed increase is probably due to the Amiga's hardware
blitter. I guess the s/w for the emulator makes use of it somehow.
I really have no idea how the various ST speed-ups would work, but it'd be
interesting to see.

>Also, the
>software emulator I saw working worked at a decent speed when in high-res
>monochrome mode (flicker often got pretty bad though). But, in medium
>and low res modes, the speed was significantly slower - not anywhere near
>what the high-res was. I guess that was it having to keep up with the
>color planes. I'm not saying that the others are this way to, it just
>makes me wonder. In Germany it wouldn't matter so much, as the migh-res
>monochrome mode is the most popular way to set up STs there, and most of
>the software will run in that resolution.

I haven't seen any of them in action, so I'm not sure about their
relative speed. What I'd be more interested to know is whether they'll
work with non-68000 Amigas... I've got a 25MHz A3000 here (which also
kills the flicker problem). Do they take over the machine entirely (a la
Amax) or will they run as a process under AmigaDOS, or even come with
their own on-board processor? HD support? As you can see, I've got a few
questions about these emulators myself....

>You said that there were several ST emulators in Germany and this was
>based on one of them. Perhaps its not the same one I read about then,
>but I had only read about one confirmed ST emulator in Germany. It had
>been demonstrated at a computer show over there. Of course, I could have
>easily missed the others, I don't subscribe to German computer mags....

I'm fairly sure I've read reports of two emulators being shown, but I
can't remember where I read about them, and it was only a brief blurb
somewhere without much information.

(It'd be interesting if a TT emulator showed up here before the TT did :-)

Don't take this as Atari bashing or Amiga fanaticism (despite my .sig)
but I really don't think there's much of a market in the US for ST
emulators. The only legitimate users will most likely be those who have
switched or are thinking about switching from ST to Ami. Others will most
likely just get it as an "oh, and I can do this, too" kind of thing,
pirate a few pieces of ST software, and proceed to let it collect dust.
Of course, there's always the problem of how to get ST ROMs, and they'll
probably end up being pirated also, such as has been done with the Amax
Mac emulator. Just dump the ROMs to disk & hack the emulator code to load
it from disk. Pirating an entire computer is sinking pretty low, but that's
what's very likely to happen with these ST emulators...

You CAN put programs (supposedly, I've never tried it.) in EPROM
and plug them into the Cartridge port. The ST will treat the Cartridge as if
it were another storage device like the floppy or hard disk. Look in
ATARI ST Internals (page 97) for a discussion on how to put programs
in EPROM.
```

16. LiNK (MNP in software)

Date: 1991-01-02 02:32:46 UTC
From: steve@thelake.mn.org
Message-ID: <A2752910881@thelake.mn.org>
Source record: 236173

I've been playing around with a program called LiNK that purports to implement a level of MNP error-correcting and a companion program called Turbo2 that is supposed to provide real-time compression/decompression of data over a conventional modem connection.

I've called a variety of modems -- Multitech, USR and a couple of Telebit T2500s -- but I haven't been able to initiate MNP of any sort. I'm calling with a 1200bps modem, using software that I wrote that doesn't do anything kinky. LiNK consistently reports ``host not responding.'' I had hoped to find LiNK communicating with firmware MNP. If it only works with other LiNK systems, it's not worth much.

Has anybody on this net found LiNK useful? Any tips?

I was trying to do something with 8-bit keyboard input, and use the ALT key to signal "hi-bit on" I'm reading with Bconin. The general idea was to see if the translated character is zero; if so, and kbshift indicates ALT, I would re-translate the scancode using the standard keyboard mapping tables and plug in the top bit.

Mostly, this works fine. But the keys in the top row, between "1" and "=", get 0x76 arbitrarily added to their scancodes before being returned to me.

Of course, once I knew this I could compensate for it. But does anyone know the rationale for dickering with something as basic as the scancode? It's the 11/86 ROM, if it matters.

>image wouldn't be so bad? Dunno. Like I said, I'm not a real artist.
>:^)

Look, if this is just some big joke to you, please stop posting to the Net at all. I don't have time to waste and I know a lot of other people who are likewise busy trying to earn a living, but are willing to take time to help each other by sharing their very valuable information. Now, on the chance that you really want to know the answer to your question, it's like this. "Changing colours" is not a single describable function for an artist. What an artist will do will depend on things like the medium in which he's working and the point at which he is working, but generally, no, you're wrong. Take an artist working with acrylics or oils and well advanced in a painting. S/he reaches a point where a detail is needed. The artist will probably lift up the palette to the work. It's obvious really. Why would an artist concerned with a precise colour want to guess what's on the brush or knife? On the other hand, I've seen artists take a tube and dab a colour straight onto a canvas and then work it around. But even then, you could say that the artist decided on the final colour mix while comparing it to the whole work. Chosing colours in that regard is never "in isolation" from the piece.

I don't think you realize that the human vision system sees colours as a relative matter and not as an absolute. If your really interested, you should do some real research into it because I'm certainly not going to teach you the "carotine cycle" and current theories of how the brain works. But the bottom line is simple. An artist generally wants to see the work.

>- Then again there was the disappearing cursors. That was another

>
>Perhaps I should have been more specific to say "Degas Elite" instead
>of Degas. I've never used Degas. It was a mistake to bundle the two

I used both. The disappearing cursor was never fixed. It's
still a problem. By the time I bought CAD-3D version 2.0 I got
really peeved with Tom Hudson. In both "upgrades" he never addressed
the fundamental problems with either program. He just added more
"features". In effect, his programs have long lists of "features"
yet do little more than get in your way when you're trying to get
things done. You know, to this day I have yet to find anybody
who actually used CAD-3D to *create* an object. At most they used
it to do a fancy render. But the "D" in the name of the program
is supposed to mean "design", and refers to the creation of the
objects. Anyway, I'm happier now with CyberSculpt. Be this is
digressing again. . . .

>

>a paint program.

Ironically, I've only done a bit of animation work with
CyberPaint, but on the contrary, I've found it a *wonderful*
paint environment. One of the fantastic advantages is that I
can bundle a group of related pictures together in a single file
which will load and unload all at once. Yup, most of my .SEQ
files are *not* animation sequences at all, but simple bundles
of related pictures.

>the other is for the image. Finally, TIPS and RIO also implement a
>nice interface with a menu that appears up over the image when you
>press the right mouse button or the stylus button.

I've tried some Mac paint stuff casually, but I don't own
a Mac. I couldn't tell you the names of what I tried. Overall,
the main problem with the Mac programs is that because they are
single button oriented, they tend to be cluttered. You generally
work with the menu on the screen all the time. I don't want that.
I want to see my picture. In effect, 1. I don't want menus on
screen at all when I don't need them and 2. When I need a menu
I want as little of the screen taken up by them as is possible,
and definitely not obscuring the main part of my work unless
unavoidable. Is there some point to this discussion? It's not
helping me get my program done.

- I had hoped to find LiNK communicating with firmware MNP. If it only
- works with other LiNK systems, it's not worth much.
-
- Has anybody on this net found LiNK useful? Any tips?

Yeah, you need another ST running LiNK in order for it to work. I have it running on my BBS (which will be back up at the end of January). I like LiNK and I wish more people would use it, although some complain that there are a few problems with it. Some people have even used Ymodem-G successfully with it. People I've talked to (mostly on Fidonet) use LiNK without TURBO16.PRG because they blame TURBO16 for the problems. It's incredible, though, seeing something like 500cps on a 2400bps modem.

Oh, and read the docs. ;^) It tells you that you need another system running LiNK and how to engage/disengage it.

Well, he found me and I am fixing the problem as well as making
some changes to DCACHE (i.e. resizing a cache after installation).
When I'm ready I will post the new version to comp.binaries.atari.st.

(BTW, Michael Fischer's bug report is the first reaction on DCACHE since
I wrote it. If any other problems exist and/or features are wished, NOW
is the moment to make me aware of them to possibly incorporate them in a
new version !)

Using Barrel you spool your output to a RAM buffer first, then you call
Barrel again. It will let you write the RAM buffer to a disk file then.

Source record: 236184

```
Recently uploaded to atari.archive.umich.edu: TEX_DOCS.ZOO

This is the file README.1st:
--------------------------------

The files in this ZOO archive provide an introduction to TeX and LaTeX which
may prove useful to the beginning user.

ESSENTIAL.TEX - "Essential LaTeX". Contains VERY basic information.
Run this through LaTeX.

LAYOUT.TEX - Shows the page layout for LaTeX. Run it through LaTeX

README.1ST - This file, information only.

TEXINTRO.TEX - "A Gentle Introduction to TeX". Very nice intro.
Run this through TeX.

These items were in the DECUS TeX collection for the Fall of 1990. We use
LaTeX quite a bit a work, and for a VMS system, the DECUS TeX collection is
-quite- complete! Highly recommended.

BobR , re the GEnie charges.

Yes Bob I did mean to say the Star services _only_ cost $us4.95 per
month. I agree the rt's off peak charges are only $us6.oo per hour and
it is cheap at that cost.

May I suggest you read issue 551 of Z*Net, and read the Z*Net New Zealand
section. This will give you my views and say the bandwith here.

I for one have had a drop and a BIG one in charges ie my monthly bill
on GEnie with the introduction of the Star Services. This new service
has saved me over $us75.00 per month as email is a star service now.

Happy 1991. See you in the ALL SYSOPS RTC on Page 475 on Saturday the
5th of January 1991 at 9pm EST [usa time] or the 6th January 1991 3am

I have been notified that the file ESSENTIAL.TEX requires a style file for handouts called HNDOUT.STY. The DECUS TeX collection includes this style file, but I have no idea whether the Atari ST collection has this style file. I have uploaded the file HNDOUT.STY to the atari.archive server, so it should be available shortly. Sorry for any inconvenience.

Any GNU experts out there? It'd be nice to have a list of pathnames
for atari.archive and dsrgsun which point to various GNU software -
The aim being to get complete working packages of the latest 'bestest'
software. Like for Emacs, GCC, G++, Scheme?, etc...

I don't know about anyone else but it's quite confusing to see
multiple versions with multiple (and often incompatible) libraries,
etc. Perhaps a system could be devised to facilitate the process of
distribution? packages like TeX, GNU software, and others would
benefit. There are other releases of software that don't suffer from
this, likely planned I would think!

Cheers,

Joe

31. STE compatible software

Newsgroup: comp.sys.atari.st
Date: 1991-01-02 16:12:21 UTC
From: whitcomb@aurs01.uucp
Message-ID: <59404@aurs01.UUCP>
Source record: 236182

Is there a definitive list of major ST software that will or
will not run on the STE? I have been trying to recommend
programs to a friend with an STE, but I can't be sure what
will run. (I was crushed when my trusty old "Star Raiders"
refused to run on it.)

I can only make a few contributions. These programs work on the
STE (as far as I can tell):

Data Manager Professional
Their Finest Hour (better colors than ST!!)
Battlehawks 1942
Codehead Utilities
Dr.T's Tiger Cub, KCS V3.0
Atari Joust, Crystal Castles

Also, is the Mega STE going to have TOS V1.6, or higher? Will the
famous STE bugs be fixed for its release? I'm curious if it will
be worthwhile to upgrade from a Mega 2 to a Mega STE.

(My apologies if you've seen this before, but I stupidly typed "north america"
as a distribution keyword instead of "na")

I've been thinking about setting up my own BBS, so I got the three STadel
archives from atari.archive. Now, they contain a *lot* of useful utilities
and stuff (is there a new version of the jsh shell?), but they don't include
the source, and they are apparently some files not included (such as aide.mnu),
and they don't include a place to which I could send money if I decide
to use it. (I try to pay for shareware I use.)

So the questions are:

1) Does anyone actually have the "other" distribution of 3.3c, with the
files that are missing from the atari.archive files? --preferably
source as well, but it won't ruin my life if the sources never show.

2) Does anyone have an address for David "orc" Parsons, so I can send
him money if I decide to use it?

Thanks for your help.

John McMullen

Subject: Monochrome monitor shakes -- request for summary

After moving my machine to a new room, I find that my aged but usually
reliable SM125 monitor has developed an intermittent case of the
monitor shakes. I recall people were talking about this but didn't
bother to read the posts (after all, my monitor was usually reliable).
Could someone please e-mail me a summary, please? (Don't post; no need
to waste bandwidth, and I might not see it: we expire news awful fast here.)

Thanks!

I've heard about problems with PS2FORM due to identical serial numbers being placed on all disks. I've also heard about a program which does put random serial numbers. I could not find this program.

I like to keep ALL my data disks formatted to IBM incase I need to swap data with IBM users. (For some reason I can't convince everyone in the world to buy an ST ;^)

jvt@its.bt.co.uk (John Trickey) writes:

- I too have recently re-discovered the Typist - or at least I think
- it is. I occasionally use mystic to format higher capacity disks
- when I don't want doMeSDOS (is that a UK joke) compatibility. I have
- found that mouse movement too soon after clicking the format button
- causes a key down fault. This appears to be the ESC key as the
- directory windows are updated although pressing any key will stop
- the problem. This is 100% reproducable on my system and does not
- seem to require the presence of any other accessory. As yet my cure
- is to count to 5 before moving the mouse - but if those chasing this
- bug want more info I will look at it more seriously (by email please).

This occurs not only with Mystic, but with all, if not most, desk accessories using the pseudo-multitasking feature. I have experienced the repeated key syndrome while uploading with STalker, the do-everything-in-the-background desk accessory terminal program by Eric Rosenquist, and typing in a text editor like STeno, which comes with STalker. (No, Eric didn't pay me to say that. He just writes great programs.) I asked him about the problem and he's looked into it a lot, but hasn't found a cure. It seems Atari hasn't been to helpful in discovering a cure, or even recognizing the problem. If I remember correctly, it's the keyboard interrupt interfering with the multitasking (is it 'evnt_multi' or something like that?). He mentioned something about waiting for Doug Wheeler's (from Gadgets) routines from the Megatalk board, I think. He said they should work right. I'm not sure what correlation Megatalk board has with it, but it sounded promising. :^) I asked Eric about this a while ago, so my memory about it is a little foggy.

- Is there a definitive list of major ST software that will or
- will not run on the STE? I have been trying to recommend
- programs to a friend with an STE, but I can't be sure what
- will run. (I was crushed when my trusty old "Star Raiders"
- refused to run on it.)

There are very few programs that do not work on the STe. I guess
Star Raiders is one of them. :^) Some games will not owrk because
they make programming shortcuts and didn't heed Mother Atari's rules.

- Also, is the Mega STE going to have TOS V1.6, or higher?

Yeah. It should have the new 'TT desktop.' Other than that, it
seems to be the same as TOS 1.6.

- Will the famous STE bugs be fixed for its release?

What STe bugs?

- I'm curious if it will be worthwhile to upgrade from a Mega 2 to a
- Mega STE.

Yes. I've even been thinking about upgrading from my STe. :^) But
I probably won't. I'd miss my ICD booter software and could just
install an ADSpeed to get the 16Mhz. A detachable, nice-looking
keyboard (not a KX or Zkeys hack job with IBM keyboard) would be nice
too. (BTW, there's something called a Megamater cable which lets you
connect a Mega keyboard to a 520/1040. If the MegaSTe and TT uses
the same modular phone jack, I wonder if it would work.)

>returned to me.

That's not arbitrary; it's part of the VDI spec, which is really just a codification of the behavior of the IBM PC keyboard/scancode characteristics. I don't know WHY it is, but the keys from 1 to = are defined to return scan codes 0x78 to 0x83, and that's just the way it is.

> Is there a definitive list of major ST software that will or
> will not run on the STE?

STart magazine included a compatibility list in it's Dec. 1990 cover
story on the ST. I quote from it:

"Extensive testing by European sources shows that less than a quarter
of the available games run on the STE."

It goes on to say that programs that break the TOS developer guidelines
(Microsoft Write being one of them) will most likely not run on the STE.

Here is START's very noncomprehensive list of programs that DO run on the STE.

WORD PROCS/DTP	GRAPHICS	PROG/OTHER
1st Word Plus	CAD-3D 2	GFA Basic 3.0
Calamus 1.09	Cyber Paint	HiSoft Basic
Fleet St. Publ.	DEGAS Elite	Laser C
Pagestream	EasyDraw	MWC
Wordflair 1.0	Spectrum 512	Lattice C
WordPerfect 4.1	Touchup	Phasar 4.0
Word Writer 1.0		

The list also included about two dozen games that run on the STE,
including Chessmaster 2000, F-15 Strike Eagle, Gauntlet II and Ultima II.

I wish someone would compile a more comprehensive list, something
like the excellent Spectre compatibility lists found in Dave Small's
newsletters.

Quick Index reports the Mega STe has TOS 2.2 installed...

It apparently fixes those known bugs in lower versions of TOS too...

This is essentially the TT TOS, and adds lots of nice features..!

Don't expect any more updates to UniTerm beyond the last 2.0e 014(?) version.
I ran into Simon Poole at a meeting in CA last summer, and he definitely left me with the impression that he's had enough of working on it. I don't recall if he still has an ST...

In my case, I have moved to STalker by Eric Rosenquist who lives right here in the Ottawa area. I am extremely satisfied with his product which I highly recommend. If you obtain a copy, be sure to send in your registration as Eric provides excellent support; heck, he even added the capability to use the contents of a FunctionKey as part of the dial string for me. I need to send (currently) up to 39 characters to my modem for some dialing sequences; so I asked Eric what he could do... The current version (2.06) has this feature. In fact, Eric went the extra mile on this one and allowed multiple F-key strings to be used (will not allow a circular reference though). That kind of support has sold me on his products.

Anyway, we started on UniTerm which was provided to the ST community by Simon completely free/gratis/no-charge; he also supported his excellent product very well. However, I strongly believe he has moved on to other things.

Simon: I suspect you are no longer reading this newsgroup, but if you are...
How are you? Can you let us in on what you're up to these days?
Even if it's only fishing... :^)

UniTerm and now STalker/STeno: Two of the best, and best supported products for the Atari ST line.

My only relationship with Simon and Eric is as a very satisfied user of both products.

Cheers,
Pierre

Oh! Almost forgot: STalker works on Moniterm monitors, Overscan mods, and (I think) even on the TT!

```
Hi everybody out there,

Merry xmas and a happy new year!

And here is my question :

Does anybody know how convert Amiga samples to
the .snd - format used by play, digivec and all
these funny pd soundlpayers?
The .snd format is compatible to the one that the
apple MAC uses.
(the amiga samples are in RAW DATA format,
but a friend of mine can convert them to any
other common amiga-format)
anything may help!

Thanx in advance,
Frank

From: aiajms@castle.ed.ac.uk
Message-ID: <7676@castle.ed.ac.uk>
Source record: 236062

Dear Jim et all

Before I start my own modest offering of predictions, I would like to congratulate Jim on his "Nostra Damus" like predictions he has made on the globe and Atari, very interesting and a trifle amusing. (I would have prefered his comments on the Persian gulf than that of Atari to be honest!)

I am of the opinion that with the current state of the global economy, certainly in the US and in the UK, and nervousness over the Gulf war, that companies of whatever stature are going to find life difficult to survive. As a result, most companies will either have to push up prices (which is inflationary == bad) or cut production costs. Cutting production costs will be for most manufactures the first choice.

Now lets look at Atari. They have already cut costs in many areas in the new machines. The plastic casing on the ST is nothing short of "tacky", the keyboard feels like a spring mattress on a bed, plus the array of "99%" functionality of I/O ports. Plus the darn things are made in Taiwan.

I cannot see Atari being able to make enough savings in cost of production to keep prices as they are at the moment. They will either have to increase prices, thus placing them in the realms of PC-land which would be a difficult market for them to compete or further reduce production costs. I believe the ST is already "mutton dressed as lamb", and I cannot see them doing much more with it.

Cheers.

Subject: GRAFX

Here is the small info about GRAFX I promised some time ago.
Could you please post this mail to comp.sys.atari.st and
comp.sys.atari.st.tech because I have no access to News here in Paris...

~~~~~~~~~~~~~~~~

Product GRAFX for Atari ST
Company PROCYON
65, Avenue Victor Hugo
F-33110 LE BOUSCAT
FRANCE
tel: +(33).56 50 54 10
^
this is the international code for France

Main Features :

PostScript interpretor; automatic or interactive mode
Display previewer
Text Editor included for the creation &/or modification of sources
Ability to use directly GDOS fonts or to convert them in PS compatible
fonts
external programs for customizing fonts

Files Included :

GDOS
GRAFX v1.1
PS fonts : Times-Roman, Times-Italic, Courier, Courier-Oblique,
Helvetica, Helvetica-Oblique, Olde
GDOS fonts : News, Lark
GEMFONT.TOS |
CVTFONT.TOS |
STDFONT.TOS |> customizing fonts
STDTOUCH.TOS |
Printer drivers : SLM804, quite all the dot printers

Other features :

export GEM-metafiles
ability to customize the pre-file CONFIG.PS

Everything is included in 2 disks 3'5; it is very easy to install it on HD.

Sources are available from the MAST BBS, (612) 472-6582, in Minnesota,
which runs a Telebit T2500 -- you can snag the files at high speed using
either V.32 or PEP protocols. Use STadel to file-request "*.dir" from
the "STadel" room. MAST has source code to STadel and binaries for
STadel, Fortress, Citadel-86 and <fnord>adel. The sysop of MAST is
tacook@mast.moundst.mn.org; the BBS is a Citadel/UUCP gateway.

The problem with the sources is that they depend on the Alcyon compiler,
which almost nobody uses anymore, and Orc's personal mutant libc.a.

> 2) Does anyone have an address for David "orc" Parsons, so I can send
> him money if I decide to use it?

Orc's network address is akcs.orc@vpnet.chi.il.us or orc@jazz.sybase.com.
He has released STadel to the public domain and is (slowly) working on
a small, modular, portable replacement.

Some games, such as Gauntlet II, allow four player
to play at once. Here are the pin assignments for
the cable. You need two female 9-pin plugs and
one 25-pin plug (don't remember if it's male or
female).

Joystick 3 Parallel Port
----------------------------
1 6
2 7
3 8
4 9
6 11
8 25

Joystick 4 Parallel Port
----------------------------
1 2
2 3
3 4
4 5
6 1
8 24

Parallel port pins 18-25 are all connected to ground.

I haven't tried building this myself, so I don't know if
it will work. Good luck!

> what's very likely to happen with these ST emulators...

Which is the exact problem with some of the emulators in particular the Medusa ST emulator. I picked up a British Amiga magazine because it had a cover article on emulators. It described the Medusa emulator in particular.
The article stated that the way to get the ST roms was to take a ST program that came with the emulator that dumps the roms to disk. Then you use that to boot the ST emulator. The Medusa card was a very small being that only had a couple of chips and NO roms sockets.
BTW ST roms aren't hard to get. You can easily buy TOS 1.4 roms from any Atari dealer (finding the dealer is the hard part :-) But I doubt Amiga people would stoop to paying the ~$90 for the roms.
Any, back to Medusa. I was just amazed (or as they say here in the Brown Daily Herald: "Shocked and outraged!") that the magazine was condoning such blatant pirating. And don't doubt that Atari won't sue this company. Atari has sued in the past and they are probably strong enough in the Germany arena to do it. It just amazes me that a big magazine would condone a product that used pirating to work.

From: jhm@nixtdc.uucp
Message-ID: <1991Jan3.193440.5046@nixtdc.uucp>
Source record: 236088

I asked for the missing files for STadel. Sigh. That was The Post
That Didn't Work Right, No Matter What.

Before I'm told to RYFM, what I'm interested in is

a) aide.hlp, not aide.mnu (which is in the atari.archive files)
as I mistakenly posted;
b) information on creating floors -- aides do it, apparently,
but with what command? And what are the configuration parameters
in ctdlcnfg.sys for floors? (There are some that refer to floors,
but how to use them?)

I should have thought of phoning up MAST directly, but I was trying
to avoid phoning Minnesota (nothing personal :-). I suppose
if I borrow a Telebit from the office, it'll improve things.

If anyone can help me with these things, I appreciate it.

(I hope I've finally got it right....)

John McMullen

>survive. As a result, most companies will either have to push up prices
>(which is inflationary == bad) or cut production costs. Cutting
>production costs will be for most manufactures the first choice.

Well, companies will try to cut costs, but as for the rest of your
analysis....I don't think so.

>Now lets look at Atari. They have already cut costs in many areas in the
>new machines. The plastic casing on the ST is nothing short of "tacky",
>the keyboard feels like a spring mattress on a bed, plus the array of
>"99%" functionality of I/O ports. Plus the darn things are made in
>Taiwan.

This is all true. ST's are certainly not built to last, but what
can you expect at that price? When you buy a Hyundai, you can't expect it
to last as long as a BMW.

>I cannot see Atari being able to make enough savings in cost of
>production to keep prices as they are at the moment. They will either
>have to increase prices, thus placing them in the realms of PC-land
>which would be a difficult market for them to compete or further reduce
>production costs. I believe the ST is already "mutton dressed as lamb",
>and I cannot see them doing much more with it.

Well, if Atari raised prices, they would effectively cut their own
throat. I suspect, if sales really start to slump, they will just
slow down or stop production until such time as demand picks up. They
don't have the cash to inventory all this stuff if nobody is buying so
I think the layoff option will be the most attractive. The majority of
Atari's employees are located in Taiwan and Japan so I would expect
the ax to fall heaviest there (Besides, Atari already cut back in the
USA last year).

>Cheers.

Hey, that's my line! :-)

- Does anybody know how convert Amiga samples to the .snd - format
- used by play, digivec and all these funny pd soundlpayers?Z

Get DIGIEDIT.LZH from atari.archive. Load the Amiga sound as 'raw data,' as opposed to 'ST Replay file.' Click on CONVERT. Select Option #2 under the Options menu to save the file. Don't play the file from DigiEdit. Converted Amiga files will still sound garbled; you have to convert it back to an Amiga file for it to sound right from within DigiEdit. Use another player, like play, beep, click, or digivec as you suggested, to play the converted Amiga file.

They have already cut costs in many areas in the NEW machines? It's always been that way! All their ST computers have been what you described above since the 520ST, although I would argue that the Mega's keyboard is better. The plastic casing and Taiwan manufacturing are what make the darn things so cheap. You get what you pay for. If you want a comparable Mac, you'll pay for it.

Enough of the history lesson. I thought this was the prediction thread.

More on STadel: the last version released as binaries was STadel 3.3d, which I believe is the version available on MAST. If you're closer to Seattle than you are to Minnesota, you could call my BBS and I'll put the stuff up for you. I ran STadel 3.3d for a month and just switched to <fnord>adel, which was based on the STadel 3.3b code. 3.3d has a lot of features <fnord> doesn't have, but they're working on it. One of the advantages of <fnord> is that it is still being actively supported, whereas orc has stopped working on STadel.

STadel and related files I have:

STadel 3.3d binaries, documentation, and help files
STadel 3.4a sources
<fnord>adel 1.30 binaries, docs, and help files

Any or all of the above can be made available to you if interested. Drop a note to me (Sysop) on my BBS, Snickersnack at (206)869-8697 (300/1200/2400).

69. Mac 128K ROMs ---> questions

Newsgroup: comp.sys.atari.st
Date: 1991-01-04 01:26:11 UTC
From: rrwood@contact.uucp
Message-ID: <1991Jan4.012611.23146@contact.uucp>
Source record: 236065
Cross-posted to: comp.sys.atari.st,comp.sys.mac.wanted

Someone recently posted a request for 128K ROMs to be used with his Atari ST/ Spectre GCR. This prompts me to ask two questions which I've been curious about for a while:

1.) Why doesn't litigation-happy Apple sic their lawyers on Gadgets by Small?

2.) Why doesn't anyone talk about how easy it is to duplicate a set of Mac ROMs instead of forking out the cash for an official set? All you need do is borrow a friend's ROMs and an EPROM (or EEROM) burner...

I hope this elicits a response from someone official at Apple, or at least from someone with answers.

-Roy Wood.

70. SOZOBON Problem

Newsgroup: comp.sys.atari.st
Date: 1991-01-04 02:18:21 UTC
From: gray@diemen.utas.edu.au
Message-ID: <1906@diemen.utas.edu.au>
Source record: 236072

Hi all,

I recently FTP'd the SOZOBON compiler from ATARI.ARCHIVE, along with the GULAM shell and ELVIS (trying to improve my knowledge of C).

Trouble is, after I run ELVIS, the Sozobon linker (LD) will fail, with a message saying it can't open the output file. What is even more confusing is that if I quit out of Gulam and then restart, everything worts fine until I use ELVIS again. It seems as though ELVIS is doing something it shouldn't, but if this is the case why doesn't an earlier part of the compile stage fail?

The problems occur when I use both MAKE and CC (as supplied in the Sozobon kit).

My machine is a Mega 4 (TOS 1.2) and I run Gulam from Neodesk. I have tried disabling all of my AUTO folder utils and DA's, and even Neodesk, running Gulam directly from the inbuilt desktop, but I still get the problem at link time.

If I use the -v option to CC (to see the progress of commands) I notice odd graphic characters after one of the file names passed to the linker, but these seem to be visible both when the linker works and when it doesn't.

Also, if I use MAKE rather than CC (using just the simple form 'make xx.ttp') I can tell if it's going to work or not almost immediately - if MAKE displays the command it passes to CC then the I know the compile is going to work. If make doesn't display this, I get lots of disk accessing (ie., going through the compile stages) and then the link failure.

Has anyone else seen this problem before? Can anyone suggest a fix?
Heres hoping...!

72. SOZOBON Problem (Again)

Newsgroup: comp.sys.atari.st
Date: 1991-01-04 06:43:37 UTC
From: gray@diemen.utas.edu.au
Message-ID: <1907@diemen.utas.edu.au>
Source record: 236076

Hi all,

Further to the problem I reported earlier with SOZOBON C/GULAM/ELVIS,
I seem to have stopped the problem with the loader not being able to
write to the output file (somehow) - now I get the following:

```
cc -v q0502.c <==my command to compile a program
c:\sozobon\bin\hcc.ttp q0502.c
c:\sozobon\bin\jas.ttp -l -u q0502.s
c:\sozobon\bin\ld.ttp -p -u _main -o q0502.ttp -f ldfile.tmp
Undef _main from \sozobon(main.o)
Bad sym type
cc: loader failed
```

This happens only after I run ELVIS. If I quit GULAM and then rerun it
and try the compile, all is dandy. Run ELVIS and bingo - she fails.

By the way, ELVIS identifies itself as version 1.3, GULAM identifies
itself as "beta test version 1.03.04.05 121887", and the Sozobon stuff
is 1.2.

Any thoughts?

On GEnie, STadel 3.3d is actually posted.. though there isn't a whole lot of
source code included. There *is* source code for the main program...

I'd be interested in hearing from anyone who uses STadel as a news/mail
reader. I never managed to get it to work.

Repeat after me:

"TeX and LaTeX source files (with the .tex file extender) are ASCII files."

"TeX and LaTex device files (with the .dvi file extender) are BINARY files."

"I can read TeX and LaTeX source files with any text editor (or even the SHOW option from the desktop). There is no reason to complain about TeX and LaTeX source files being unreadable."

[Perhaps after repeating this mantra a hundred times it'll get through to people....]

From: mathew@mantis.co.uk
Message-ID: <D939u15w163w@mantis.co.uk>
Source record: 236093

I'm looking for software which will handle Usenet news and mail on an ST.
I don't need the UUCP stuff, just the newsreader / batcher / unbatcher and
mail front end.

Can anyone help?

mathew.
[Oh, and please *DO NOT* mail me any binaries!]

With 1 meg SIMMs at about $30/meg now, I would agree with the above. RAM usage isn't as important as the addition of the newer (hopefully less buggy) features.

Cheers,

Chris

82. lattice c 5.0

Newsgroup: comp.sys.atari.st
Date: 1991-01-04 16:02:05 UTC
From: tellabs_canada@canrem.uucp
Message-ID: <19914.1113.4481@canrem.uucp>
Source record: 236084

Hello all,

Only several days ago I purchased Lattice C v5.0. I would like to move all of my future projects over to this compiler system but I'm more than just a little uncomfortable without a make utility (Lattice doesn't include one).

I have both MWC and Laser C make (don't ask me why I own both - it's a long story :) and I realize that I could use these with Lattice, but I'm no make guru, and I forsee a long and troublesome time ahead as I try to get either of these makes to work with Lattice.

Has anyone successfully modified either of these makes to run with Lattice 5.0? If so, could you show me how?

Thanks in advance,
Mark

83. Driving/Racing Simulators

Newsgroup: comp.sys.atari.st
Date: 1991-01-04 17:38:49 UTC
From: rcd@cbnewsj.att.com
Message-ID: <1991Jan4.173849.6845@cbnewsj.att.com>
Source record: 236086

Well, after upgrading my ST to 4 Megs, I found one program that doesn't like the extra memory! It's a game called Test Drive, by Accolade - it loads and runs, but you get two bombs as soon as you crash your Ferrari Testarosa! So first your car crashes, then the program does! Hmmm...

Test Drive actually does a good job simulating the acceleration and other characteristics of actual sports cars. I was wondering if anyone can recommend their favorite driving or auto racing simulation games? I have heard of Lombard Rally, is that a good one? I know I'm asking for too much here, but, ideally, I would like to be able to run the game from my hard drive.

By the way, we ought to compile a list of games/programs that are so badly written that they refuse to run when you ADD RAM to your system!

Thanks in advance for any recommendations. Happy driving!

Rana Dutt

>gcc -c -gg foo.c
>gcc -o foo.prg foo.o
>sym-ld -r -o foo.sym $GNULIB\crt0.o foo.o -lgnugdb

I think you have to include -gg on the second gcc command line, as well
as the first. That way the executable is compiled with gnugdb.olb,
too, not gnu.olb as it is without that option. Check the output of

gcc -v -gg -o foo.prg foo.o

to see what options and files gcc is giving to gcc-ld, and give those
same options and files to sym-ld (in addition to -r).

On the other hand, I haven't used gdb since it bombed for me the first time,
so I don't really know.

chuck@mrcnext.cso.uiuc.edu (charles bridgeland) writes:

- what are it's capabilities? vt-100?, what else?

Well, it does a lot of nice stuff, including VT-100. Uploading and downloading (Xmodem and Ymodem-Batch, Zmodem on the way) in the background. Right now, I'm in STeno editing this message. Then, I can hit ALT-A to Select All and ALT-X to cut everything into a clipboard buffer. Then I hit ALT-Tab and it toggles over to STalker where I hit ALT-V to paste back into the vi editor. It may sound a bit confusing at first, but after a while or if you watch someone go through the process, it's really quick and, I think at least, A LOT nicer than Flash's and Interlink's terminal program/editor combos. A script language is also on the way for version 3.0.

- Uniterm is very nice, but pretty much fills my 520, so I'm kind of
- on the lookout for something a bit smaller, that doesn't necessarity
- have all that stuff I don't need (like tectronix emulation).

STalker and STeno are pretty big for desk accessories, although you can configure how much memory their buffers consume. One meg of RAM is recommended, if not almoot required. I have one meg with NeoDesk, Turbo ST, STalker and STeno, and a few little things loaded with ICD's booter (taking about 200K). It's pretty snug having only 65K left, but still usable. If I need to do any memory-intensive stuff, I just reboot and don't load STalker and STeno.

I had a similar experience with SDI.. it lets you install a Ramdisk if you have a 1040... but ONLY a 1040 (1 Meg RAM, actually).

To get around this, I used an old program called MAKE1MEG.TOS (left over from the early days of piggybacking RAM. Some programs assumed 512K and bombed if run in 1 Meg, thus there was a pair of programs called MAKE512 and MAKE1MEG to fool the ST into switching back and forth.)

It might be worth giving this a try with Test Drive also...

89. TT Desktop

Newsgroup: comp.sys.atari.st
Date: 1991-01-05 00:20:16 UTC
From: seitz@netcom.UUCP
Message-ID: <20031@netcom.UUCP>
Source record: 236094

Pertinent quotes from ATARI EXPLORER January/February 1991:

From the Dialog Box column: "View from the Top", by Sam Tramiel:

"Atari brought several TT's to Comdex. Installed in these machines will be the new GEM desktop, a strongly revised and enhanced version of the ST user-interface, designed primarily for the TT, BUT ALSO COMPATIBLE WITH PRESENT AND FUTURE STs [emphasis mine]."

From "The TT Desktop: Hands-on" by the Atari Explorer Technical Staff:

"Though the new Desktop and CP were designed primarily for the TT, much of the software is FUNDAMENTALLY COMPATIBLE WITH CURRENT ST SYSTEMS [emphasis mine], particularly the STe. It is likely, therefore, that within the next several months, the ENTIRE ST COMMUNITY MAY BENEFIT FROM ITS RELEASE [emphasis mine]."

Looks like Atari is seriously concidering releasing the TT desktop for the ST. My guess is that user demand may be the deciding factor. If you want the TT desktop, I'd recommend writing to Atari and ATARI EXPLORER. Check the latest issue for addresses.

Re point 1, why should Apple do anything to Gadgets? Gadgets in no way encourage the acquisition of Apple's copyrighted software (ROMS or system software) by any unlawful means (if anything, they actively discourage it). Gadgets produce a polished product, that, with the addition of Apple components can emulate a Macintosh. Even Apple would have a hard time getting a judge to believe Gadgets were in the wrong.

Re point 2, sure its easy to duplicate a set of Mac ROMS instead of forking out for the official set. No one talks about it for the same reason no one talks about how they can get drugs - its illegal! Surely you must realise that (or are you just looking to generate some network activity?)

STalker is also my favorite term program. I feel it's the best. The VT100 is solid and there are only a few features that I miss (kermit). I'd also like to commend the authors for there excellent support. They were extremely helpfulwhen I couldn't get background downloading to work properly. (Don't use 2 screen savers) Actually they called me back from Toronto twice!!!

That's support. This program is very reasonably priced and I feel if there's any justice in the world Strata Software will be rewarded by Atari users buying this program and seeing a new standard in Atari software and support.

Ok, I have been using Gulam now for some time. I have been using Uniterm for its VT100 support. However, I would like a small .TTP or .TOS program that supports VT100 and has no other features. Just run it and it communicates with the Modem and takes VT100 screen codes. Oh, I guess a Quit command, via the Undo key, but that is it. I would like to type "term" and have this come up instead of the Gulam term command (which is vt52, not 100). C-Kermit is also just vt52 (for those who know what I am talking about), so it doesn't help me as a terminal program. Since I am starting to like C-Kermit because of its similarity to C-Kermit under unix, and I only use Uniterm for the VT100 stuff, then I don't really need all that Uniterm offers.

I have tried all the terminal programs from atari.archive and they all seem to be just vt52.

If I have overlooked one somewhere, please point me to it, as in what FTP site it is at. This seems like a simple thing, since all I want (need) is vt100 support. Maybe someone who has experience programming with vt100 codes can whip this up.

97. switching res

Newsgroup: comp.sys.atari.st
Date: 1991-01-05 09:31:06 UTC
From: sslee@polyslo.CalPoly.EDU
Message-ID: <27859cda.6547@petunia.CalPoly.EDU>
Source record: 236004

Does anyone know of a legal or illegal way to switch resolution without going through the desktop? This would be convenient to write low res programs while running in medium res (such as using Laser C). I have TOS 1.0 but I suppose I could check the TOS version and use differenct methods if necessary.

The only thing that remotely comes close to what I wanted was in a program called AVS.PRG (Audio-Visual Player by Jim Kent, released by STart). For example, if you were in medium res and wanted to be in low res...

```
char *ainit=(char *)a_init; /* Line A call, $A000 */
Setscreen(-1L,-1L,0);
*((int *)(aline-692))=319; /* Mouse X limit */
*((int *)(aline-690))=199; /* Mouse Y limit */
*((int *)(aline-666))=16; /* # of bitplanes */
```

Apparently, that works in setting the boundaries for moving the mouse cursor. It also shows the correct colors. Unfortunately, it does not center dialog boxes correctly, does not clear the area under the drop-down menus, and some VDI functions (such as drawing ellipses) do not work as expected.

I know using Line A is not recommended in the TTs but this is for my own personal use.

My favourite ST racing game has to be Stunt Track Racer. I think
it is called Stunt Car Racer in Europe.

I've never played Hard Drivin', but I've hear negative things about
that one. I personally would like a comparison between Stunt Track Racer
and Power Drift. Anyone have them both?

On a related note, Bad Company is pretty good shoot-everything-
that-moves game. I just love mindless violence. I was kind of disappointed
with F29 RETALIATOR though. Graphics are not too bad, but game play is
not very good.

Multimedia for the ST

Becuase Hyperlink has generated quite a lot of interest in the ST
world, I thought I would mention again that you can come and see
Hyperlink at the Atari Users Group of Brantford. Author
George Geczy of JMG Software International there to do the
demonstration.

7:30pm, Thursday January 10th, 1991

Junior Achievement Centre
197 Colborne St
Brantford, Ontario

I can be contactd at (416) 628 - 4051

Cost is $5 for admission, newsletter, and PD disk swap. Bring a
blank disk, and receive a disk with PD software.

Please post this message on any BBS where there are ST users.
Thank you.

By the way, I have not yet tried to install this on my own system, so please don't ask me about it at this time.

And I forgot to mention, gcc 1.38 has a new flag "-mint" for compiling code for the MiNT kernel. (I don't know if it really affects code generation, it seems to just cause the MiNT library to be linked in before the regular GNU library.)

104. Major Problems Unpacking 'lzh' Files

Newsgroup: comp.sys.atari.st
Date: 1991-01-05 20:48:41 UTC
From: wrs@infidel.lanl.gov
Message-ID: <10472@lanl.gov>
Source record: 236008

I've recently gotten back into using my ST, and have been trying
to download various files from atari.archive.umich.edu, but I'm
having MAJOR difficulties unpacking 'lzh' files.

I've been downloading files to my ST via Z-modem, and 'arc' files
have unpacked with no problem. When I try to unpack 'lzh' files,
however, the various unpackers keep choking on the files---usually
some sort of CRC or CRC-header error. I've tried several different
'lzh' de-archivers as well as several different 'lzh' files---no go.

In particular, I have gotten the "starter" package from atari.archive,
supposedly the 'recommended' set of de-archiving tools, and have been
able to get LHarc 1.02 from this. But LHarc 1.02 still chokes on any
'lzh' file I give it. (As a size note, arc602 from the "starter"
package works fine, so it's probably NOT a problem of unpacking the
"starter" archive wrong.)

Does anyone have any idea what's going on here?!? Since so much stuff is
'lzh' packed, I'd really like to be able to unpack them. Please E-mail
your responses, since I havn't been reading news too often recently.

Thanks in advance,

I too am having trouble sorting thru all of this stuff, and they are huge files -- therefore trail and error is a real *pain*.

Anyways, I have recently been trying to figure out how I might be able to play around with TeX on my ST. Will I be able to do this with only 1Meg? Also, how much HD space? Which archives do I need?

The main utilitarian reason I would like to get TeX working is so that I could print out the UniTerm docs. Is there a "easy" way to print these out (I.E. a utility that just prints and nothing else?) Also I am using a cheap old dot matrix printer (SG-10)..

I think DVI is a TeX file previewer and MetaFont is a TeX font maker, is this correct? I haven't been able to get any of this stuff to run correctly yet.. ....thanks ahead of time.... yonderboy@cup.portal.com

Anyone know where I can find Nitelite BBS (PD)? If you can upload it to atari.archive, that'd be great!

Anyone have any experience with Script, the word processor? Has anyone read any reviews? I've seen this program at my dealer and it looks pretty good, but it's difficult to critique a program without REALLY using it, besides just playing around with it. At first glance, it looks pretty good. Different fonts, importing of images. Quick scrolling. Automatic text formatting like Word on the Mac. But, I couldn't figure out how to delete a page, or even a series of lines without highlighting them with my mouse. Any info would be greatly appreciated. Thanks!

I didn't include the information in my original posting because I didn't want
to be flamed for "commercialism". :^)

Therefore, in direct response:

STalker/STeno, if not available locally, can be obtained by
writing/calling:

Strata Software
94 Rowe Drive
Kanata, Ontario (Ottawa area, not Toronto)
Canada K2L 3Y9

GEnie : E.ROSENQUIST
Bix : e_rosenquist
Ph/Fax: (613) 591-1922

I think Eric has both a Fax machine and an answering machine
connected to this line (but don't hold me to that information).

He also provides support on the National Capital Atari Users'
Group (NCAUG) BBS in Ottawa (613) 737-1133; there is an area
on the BBS for registered users.

I think you get the idea about the level of support he provides.

Possible conflict of interest disclosure: :^)
I know Eric through the NCAUG club. His wife works in the same building I do.
I am a STalker beta-tester. I am in no other way associated with Strata
Software. I receive no remunerations. I am just a VERY satisfied user.

STalker/STeno retails for under CAN$40.

Little known STalker info:
- mini-BBS mode
- supports SHADOW (from Antic)
- supports DC-Port
- runs on ST, large monitors, Overscan

- runs as either .ACC or .PRG
- V3 will support:
- a C-like language
- features will allow STalker to be programmed to auto-dial unattended, and do whatever you want; maybe get the latest xxx.arc from a remote BBS while you sleep and the rates are cheap...
- PC-ANSI

Pierre Fortin Bell-Northern Research I know, my postings are
Internet Systems P.O.Box 3511, Stn C terse and humourless. So?

>allow Mac Midi s/ware to be run under the GCR. Is that available?

>Imran Anwar

The board that you're thinking of is the MegaTalk board, I just got the
Gadgets newsletter describing it and does it sound nice! The only downer
is that you have to have a Mega ST for it (until they come out with the
other version, heh). It has two of the LocalTalk din-8 ports and a
SCSI port that has been tested to work with Mac MIDI devices, scanners,
and even the Apple CD-ROM works apparently! Makes me wish I had a Mega.
Their list price is $299.95 and will be available by March '91 (they have
to get it to pass FCC inspection because of the added ports.) The newsletter
hints at a 1040/520 version of it in the future (as well as for the
68030 SST board!) but I can imagine all kinds of problems that that will
cause, like weak power supplies, heat buildup, and major hacking on the
plastic case of your ST. In case you haven't heard, Gadgets has also
finished the 68030 board for the Megas, but the installation won't be
as easy for the MegaTalk board, which just plugs into a Mega slot.
It requires yanking your 68000, soldering in a socket and pluggin their
board into the socket (and if you just order the board by itself, you
get to plug in the 68030, SIMMs, and 68882 yourself!) Freedom of press
also pushes me toward revealing the prices as well (it's not like I'm
giving away trade secrets or anything) -
SST board by itself: $599.00 (That's with no '030)
option A.) 16 Mhz 68030: $200.00
option B.) 16 Mhz 68030, 4 1Meg SIMMs (80ns): $460.00
option C.) 33 Mhz 68030, 68882, 4 1Meg SIMMs: $800.00
Of course, you will need to buy SIMMs, since the memory in your ST is too
slow for the 68030, the board will take up to 8 of them.
If you ask me (which of course you didn't, heh), option C is the only
way to go, if I had a Mega I would seriously think about scrounging for
the $1,400 (sure beats $3,000-$4,000 doesn't it?) You still don't have
the VME bus or super monitors of the TT, but coupled with the MegaTalk
board, you've got networking and SCSI! The SST board won't ship until
April '91.

I am in no way affliliated with Gadgets by Small, just a proud owner of
the Spectre GCR.

There is a program out in the Public Domain called "junior Prommer" which allows for just this to happen.

When you set up the programs you want to run from ram drive you place them in an folder. The software then asks you if this is to be a rom drive if you answer yes it copies the who directory to rom. If you are using 27128's it will not be a problem but if you go to 27256 you will have to manually switch it.

Also you may add an auto folder with what ever you wish as the ST on boot up looks for a cart before the floppy drive. Thus this will allow you to boot from your ROM drive in the cart.

Jounior Prommer is marketed by Merlin Computer GMBH in Germany. I use here version 2.31 with the CT eprom burner and have no problem at all with it.

There is also a way if you install the RUFUS-terminal-program from
germany (shareware) as an ACCessory. Or if you've installed MiNT
you can up- and download with TOS rz/sz and maybe other TOS trans-
fer-protocols.

Bye, Olli

> How does one get a program in either of these languages to use arguments passed
> from the command line.

Personal Pascal 2 has special subprograms (called CMD_ARGS and CMD_GETARG())
to perform this function. They were also available in Personal Pascal 1.

usage is describe on page 6-198 of the PP 2 manual and 6-94 of the PP 1
manual. Basically:

Cmd_Args is an integer function which returns the number of arguments in the
TOS command line buffer.

Cmd_GetArg(i, request) is a procedure which assigns the requested command line
argument to the argument ('request' is a string variable, 'i' is an integer.

As for Modula-2, it would depend upon WHICH Modula-2 compiler you were using
and the nature of the libraries included with the compiler.

One thing that prevents people from pirating the MAC ROMS to use in the Spectre (or Magic Sac) products is that it is possible for circuitry to be designed to distinguish between the masked ROMs and EPROMS, and to make sure that Apple did not go after him, Mr. Small built said logic into his product. EPROMS don't work.

Regarding the disk-based TOS, why not put TOS on cartridge??? For that matter, why not just base all operating systems in cartridge? Think about the advantages!! Upgrades would be a simple matter of bringing the old cart in and exchanging it for the new (plus a small fee I suppose). Changing operating systems would just be a matter of changing cartridges. A cartridge based OS wouldn't take up an RAM (as would a disk based), nor would it take any time to load (again, as would a disk based OS). From what I understand, carts can hold a LOT. The Lynx cards (for those who have seen them) hold upwards of 2 MEG!!!!!! If they can hold that much, just think how much of an OS you could put in one cartridge!!! By way of price, the physical aspect of the cart doesn't cost THAT much (carts for most game machines cost between $30 and $40, and SOME of that has to be for the software). Can anyone tell me why this ISN'T a good idea???

I'm not sure, but I seem to remember that the cartidge port could
only address 128K. (I could very well be mistaken, I'm not really
a techie.)

As for the OS updates, I think the best policy I've seen so far is
at Apple. You can anonymous FTP over to Apple.Com and get the latest
version. Now THAT'S what I call service.

Yes it is! I just got the announcement about the update in the mail last week. The NewsLetter said it was ready to ship in mid-December. The upgrade from 2.65 is $20. They won't be answering phones before the 14th though, due to inventory, but they do encourage FAXing or mailing in your order.

So if you haven't received the newsletter, send in your registration!

Ok, I have had many people tell me that the image of the Command arguments is in Basepage + 128. Could someone please tell me what address is the pointer to Basepage held in? I have TOS 1.0, and cannot find anything about Basepage in the ST Internals. Thanks a bunch.

By the way, does anyone know of a good memory map of the ST? Something like "Mapping the Atari" for the 8 bits, which was a good memory map of those computers...anything like that for the ST?

Thanks..

Well, for starters: The current OS (1.4) fits in 192K of ROM, *BUT* there
is only 128K available on the cart port. If you can figure how to squeeze
the OS into that little cart... :^)

From: mathew@mantis.co.uk (mathew)
Mathew, re your request for a reader of usenet mail there is many options we have here a reader/packer/unpacker for our BBS. It is run on a michtron BBS version 3.

The packer/unpacker is writen in GFA and will unpack to where ever you want and only the news groups you define in a .inf file. So if you receive a full feed of all the atari news groups and do nt want to post say comp.sources.atari.st or for that matter read this news group it will drop them off to either a news goup called .999 or to the trash can.

If you want more information please email me or post in here.

Yes. Received the announcement newsletter yesterday -- they say 2-3 week
delivery.

Also contained an announcement concerning a 68030 upgrade card that replaces
your 68000. Can't remember the details, so I won't try and post them.

What sort of compiler are you using? The basepage stuff and parsing the
command line should be managed by the standard program startup code. If
you want to see how it's done, the dLibs sources are free. If you're using
Pascal and can't talk yourself into C and asm, try to track down the
Tackle Box ST package. (I can't help you; I sold my copy many months ago.)

As for mapping the ST's memory -- in general, it's bad magic to think
8-bit thoughts about the ST. There are good reasons for restricting
user-mode access to system variables. Besides the fact that you may wound
innocent bystanders, you may produce a program that breaks on later
versions of TOS and newer members of the ST family. If you want to muck
around in the system, use the documented system calls.

For the few cases in which you need to examine or replace system
variables, 0x400 through 0x4FE are documented in the Mark Williams C
manual and in Bantam's ``Atari ST Applications Programming.'' I think
``Internals'' documents device addresses, although you should slap
yourself for even thinking about it .... :-)

From: steve@thelake.mn.org
Message-ID: <A1840679@thelake.mn.org>
Source record: 236037

The official Atari (U.S.) magazine, Atari Explorer, is back on the newsstands with a January/February issue that includes an article on the TT and the new TT Desktop. There is nary a word of the Mega STE. The magazine has reviews of games for the ST and Lynx, but no productive applications. I don't remember seeing anything in it about the 8-bits.

The last issue was dated Spring 1990.

The new editor/publisher is John Jainschigg, who was a technical editor on the old magazine before it was shut down by Atari management in a tiff over editorial content and control.

> --

There was a lot of hype when the Magic Sac was first released stating (in big bold letters) that EPROMS would not work. To the best of my knowledge, this was and still is just that - hype. I don't beleive it is that easy to distinguish between ROMS and EPROMS with such simple circuitry as exists in either the Magic Sac or the SPECTRE carts.

Disclaimer : I am NOT advocating the duplication of Macintosh ROMS.

132. Basepage

Newsgroup: comp.sys.atari.st
Date: 1991-01-07 06:42:31 UTC
From: psurge@cs.utexas.edu
Message-ID: <16598@cs.utexas.edu>
Source record: 236039

This is to all who have helped me about finding out about Basepage, but I have the solution already. I found in my Modula 2 Library a procedure that takes an Integer and returns the address of that argument in the command line. (minus one, since the first argument is #0). All I did is create a pointer to a string and then used the pointer as the address parameter in the call.

For those curious persons, this is with ana-systems Modula 2 compiler, in the GEMDOS Module.

Thanks for all the help!

Unfortunately there is a whole bunch of LHarc versions and programs out there. Most of them are uncompatible, at least with LHarc variants running under Unix.

I don't know what people find so remarkable at LHarc (except the compression factor).

Now for the question: The only LHarc version I have found useful so far is "LHarc 1.02 based on MSDOS LHarc 1.13", ported to the ST by Bill Shroka (bjsjr@ncoast.org). With this program I had no problems unpacking LZH archives.

From: suhonen@kunto.jyu.fi
Message-ID: <SUHONEN.91Jan7105404@kunto.jyu.fi>
Source record: 236040

In article <37621@cup.portal.com> Yonderboy@cup.portal.com (Christopher Lee Russell) writes:

Anyways, I have recently been trying to figure out how I might be able to play around with TeX on my ST. Will I be able to do this with only 1Meg? Also, how much HD space? Which archives do I need?

TeX runs OK in 1 Meg, sure... HD usage depends on how much you have & what you want to do with TeX: For simple documents you need (much) less than 2 Megs, but if you want a "good" collection of stuff for professional book typesetting, you can easily use more than 20 megs...
5 Megs is enoug for most TeXperts.

What you need?? Get sttex.xxx [xxx for arc, zoo, lzh, whatever]; get a previewer; get font files as much as you wand/you have space in your HD; get format files and last but not least get pk (or pxl)pixel files for both previewer and printer driver (forgot: get a printer driver also).

All the stuff should be found from atari.archive...

The main utilitarian reason I would like to get TeX working is so that I could print out the UniTerm docs. Is there a "easy" way to print these out (I.E. a utility that just prints and nothing else?) Also I am using a cheap old dot matrix printer (SG-10)..

Yes.... If you don't mind those TeX commands in your doc, then just print all .TEX files you have, but if you do mind about those commands then find a detex program somewhear (migh be in atari.archive). detex eats all TeX -stuff from .TEX files so you can print them.

In general: .TEX files are pure ASCII files...

I think DVI is a TeX file previewer and MetaFont is a TeX font maker, is this correct? I haven't been able to get any of this stuff to run correctly yet..

NO!!! DVI is DeVice Independent output of TeX. Metafont IS a font maker, and you don't need it to run TeX (unless you wan't to make your own fonts).

I read about KOAS in the ST-magazin (german). KAOS should be a
strongly improved version of TOS 1.4 (lots faster, less buggy). In
combination with eg. Neodesk you will have a system comparable (or better)
than the RAM version of the TT-ROMs.
Does anybody know more about KAOS? (will it be available soon? does
there exist a demo version? what will be the price?)

I guess this means all info is still copied to ram on boot-up though.
It would be faster than hard drive, but memory usage by programs like
Neodesk and Gemini would remain unchanged. Or am I missing something?

I've seen a few copies of shadow still on the wall in local stores.
(At least here we have local stores) I don't think Antic is shipping
it or supporting it at all, in fact, of the 6 warranty cards I mailed
to Antic during their heyday, I never received one newsletter, catalogue
or any other ack.
I think I saw Mike Vederman complaining here, or on GEnie, that he
hadn't seen a royalty check in years. I bought, and use Shadow regularly
and would like to publicly call on DClick to follow CFJ's recent re-doing
of macro-mouse as a new and improved program, and give us another Shadow
with new and improved features like zmodem. Any others to show these guys
there'd be some sales. Shadow is excellant, except for a few annoyances,
like, if you time out in a batch download, you lose all of the files.
Other than that, it has a permanent place on my machine anyways. Thanks
to Mike and Paul, even if Antic never allowed you to provide a followup
support.

Note that zmodem usually does not recognize .lzh as an extension for binary
files, whereas it does recognize .arc. Maybe the files have been downloaded
in ASCII mode. I always download files in binary mode by default, even
ASCII files. (I download from Unix, and I can get the CR/LF characters with
a simple text editor).

143. Re: TT

Newsgroup: comp.sys.atari.st
Date: 1991-01-07 13:31:10 UTC
From: t68@nikhefh.nikhef.nl
Message-ID: <1109@nikhefh.nikhef.nl>
Source record: 236050

"How do people think about the TT?"

I think it is definitely a step forwards, but whether it is
for everyone is a matter of what you do with computers.
If you need your computer just for typing in text files that
you take to your work for further processing you can save
yourself the extra money.
At the moment the price seems to be coming down. My guess is
that they are selling many more than they had feared so
the enlarged production gives lower prices. At the moment
one can buy them already for 25% less than the price that
Atari announced in october. (Here in Holland).
This starts making it an excellent buy. Of course the
exact pricelevel is irrelevant because one would have to
compare it with the local prices of other computers, not
with dollars, marks, guilders, francs, pounds etc.

The computer is (if equally properly tuned) for my purposes
faster by a factor 4. This assumes running in TT memory
with the cache on. For a program like FORM each of these
make a factor 1.5 difference. Also compilations with Turbo C
go faster by a factor 4.
This brings us to the software:
Much of the software runs and much doesn't run.
The earliest versions of Turbo-C would mishandle the 68020
option badly. There is a newer version that is much better,
but the printf doesn't work right. But it improves.
Shell programs are also rather problematic. Many programs
assume fixed screen sizes (and sometimes addresses). On the
other hand it is possible to run in ST mode. With the color
monitor one can run in ST-Low, ST-medium, ST-high, TT-Low
and TT-medium mode. In ST-high one has just a very fast ST
and many of the programs that break in the TT modes will run.
For developers this is very fine. One can try all resolutions
easily.
Atari Benelux tried to get some TT's to developers quickly,
just to have as soon as possible some improved software.

So I think that it is a step forward, but people who had
to save their money for a long time to buy an ST won't be
able to buy a TT for quite a while. On the other hand:
My first ST was about 3300 guilders (currently $2000) and
now they cost 1300 guilders (<$800). Note that only the ratio
is relevant.

Jos Vermaseren

From descriptions and from what I've seen at shows, it's a nice machine that probably won't sell very well. There'll be disagreement, but I think it looks like a serious computer. It runs fast, with good backward compatibility. The 68030 is a good chip for programmers. The video is "Good Enough". But in a market that contains fast 80386 boxes and the NeXT, the TT isn't going to be a hit unless it's priced about where the MEGA STE is supposed to go. Pity about all the delays.

While we're at it--anyone seen a TT or a MEGA STE offered for retail sale in the US?

>
> 1.) Why doesn't litigation-happy Apple sic their lawyers on Gadgets by Small?
>
> 2.) Why doesn't anyone talk about how easy it is to duplicate a set of Mac
> ROMs i...
>

The appearance of MegaTalk raises further questions.

Originally, Spectre was a program (emulater) that allowed MAC roms to be executed on an ATARI. The lawyers seem to accept both Spectre and the Amiga version as long as they read real MAC roms.

Anyone visibly copying MAC roms (such as dealers) have been pursued by Apple. If you and a friend "share" a single set of ROMS by means of a copying machine it the same as copying the Spectre program itself. Illegal, but not likely to be enforced. (BTW copying the roms is real easy, converting a Magic Sac cartridge to hold 128K roms is also easy).

Finally:
Last year there was quite a stir in the ...mac... groups discussing a MAC clone made in the Far East. It was felt that Apple would surly strangle them.
But now that Gadgets sells the MegaTalk board which duplicates the Mac chips needed to do "appletalk and SCSI" what is the distinction of a Mega4 +Megatalk board and a MAC clone. This isn't just a software emulater! Its become a MAC clone!

Just a thought.

148. Re: GNU (as it applies to the ST), TeX

Newsgroup: comp.sys.atari.st
Date: 1991-01-07 16:17:57 UTC
From: ralph@laas.fr
Message-ID: <RALPH.91Jan7171757@orion.laas.fr>
Source record: 235864

In article <37621@cup.portal.com> Yonderboy@cup.portal.com (Christopher Lee Russell) writes:
| I too am having trouble sorting thru all of this stuff, and they are huge
| files -- therefore trail and error is a real *pain*.

Yes it IS big!

| Anyways, I have recently been trying to figure out how I might be able to
| play around with TeX on my ST. Will I be able to do this with only 1Meg?
| Also, how much HD space? Which archives do I need?

I have managed to run LaTeX.TTP on my 1040 ST w/o any problems. I do not know how large a document it could handle when all ACCs are removed.

| The main utilitarian reason I would like to get TeX working is so that I
| could print out the UniTerm docs. Is there a "easy" way to print
| these out (I.E. a utility that just prints and nothing else?) Also I am
| using a cheap old dot matrix printer (SG-10)..

The Uniterm docs come out quite nicely, especially if you can get them to a Laser printer. I haven't yet tried DVIEPSON.TTP which should work with my old FX-80.

| I think DVI is a TeX file previewer and MetaFont is a TeX font maker, is this
| correct? I haven't been able to get any of this stuff to run correctly yet..

TeX transforms a .TEX file to a .DVI (DeVice Independant) file. The DVI file can then be viewded with DVIST, or SHOWDVI, or printed with DVIEPSON, etc. If you have access to a Unix box with TeX, then you can upload the DVI file and print it there. MetaFont is the TeX font maker. There are also many little font conversion programs such as PXLTOPK, PKTOGF, GFTOPK, etc. Some device drivers only accept one kind of font file: GF is Generic Font, PXL is the wasteful pixel Font format, and PK is the PacKed format.

| ....thanks ahead of time.... yonderboy@cup.portal.com

By the way, cup.portal.com does not seem to be known from the .COM domain. I believe that it was rejected by Sun.COM's mailer.

Sorry, Dan. Magic SAC played this game, which Intel created.
But Spectre 128 reading 128K ROMS will also read EPROMS because the magic
line is not present on 128K devices.

This is the second time I've seen a request for this info in this group.
The first was during a brief time that I kept up with it in the Spring.
Then I left for several months, and just picked it up again this morning.
I sent the guy in the spring some of the critical stuff, but I don't
know if I still have it online anywhere.
If I type it all in again, perhaps I will upload it to CompuServe,
and perhaps some kind soul here would volunteer to convey it to an
anonymous-FTP site and/or to a newsgroup archive machine.

How pressing is your need at this time?
I probably won't get to this for a while.

From: ronw@cbnewsk.att.com
Message-ID: <1991Jan7.172033.26016@cbnewsk.att.com>
Source record: 235854

I have been trying to chek out the latest version of OPUS. I believe this
is 2.2. However, the archives at terminator and (knew where I meant at one time) both only
have 7 of the 9 parts of the distribution. Sooo, I
found version 2.0. The problem is, if I try to run opus.prg without
GDOS stuff (I know - no charts) I get 2 bombs. If I try running with
GDOS (G+PLUS) installed with an appropriately configured (I think) ASSIGN.SYS - I get 4
bombs! Any help out there? I like OPUS, at least
version 1.x, but I would like to know if version 2.2 supports any macros -
at the least file save/restore macros?

How about packing the part that is loaded into memory and unpacking
on boot-up? I think ST Internals said there were several tricky ways
to get 512k out of the cartridge port.
Come to think of it, wasn't there a company that sold 4 meg ram
drives that went into the cartridge port. Someone posting here a few
months ago had one.

Okay, you've almost got me convinced to buy it. Two little nagging questions remain:

1) What handshaking does it support?
RTS/CTS
XON/XOFF
ENQ/ACK

2) Why not Kermit? Will future versions support Kermit?

And I swore I'd never get another piece of ST software...

I concur. LHarc1.02, recently posted on comp.binaries is the most
stable version I've found. Some versions appearantly don't under-
stand lower case file names in the arc. This is often the reason for
corrupted header messages.
LHarc does offer a significant difference in packed size. It
probably would be the new standard if the versions weren't so
incompatable.

>include one).
>[...]

I have Sozobon C, and there is a make tool included in that
archive that I use.
I use EDC.PRG and set up my environment variables from there. Once
that is done I use one of the tool slots to call MAKE.TTP when the right
key is pressed, and of course I put MAKE.TTP in my LC\BIN directory. When
that is done, I can just press ALT-KEYPAD# to call make. You also have
to change the current directory under the file menu title to the directory
the makefile you want to use is in.
The following could be a typical makefile.

```
---------------------------------------------------------------------
CC=LC.TTP
EXE=dvert2
OBJ=main.o gui.o
DEBUG=
CFLAGS=-b1 -ca -cf $(DEBUG) -ma -ms -r1 -rs -w

$(EXE).prg: $(OBJ)
CLINK.TTP WITH dvert2.LNK
# $(CC) $(CFLAGS) -Lgv $(OBJ)

main.o: globals.h dvert2.h
gui.o: globals.h gui.h sel3.h

.c.o:
$(CC) $(CFLAGS) $*.c

.s.o:
$(CC) $(CFLAGS) $*.s
---------------------------------------------------------------------
```

A good idea would probably be to use another macro like

```
LD=CLINK.TTP WITH
```

Line number 9 above is commented out. (The one that begins with
the hash ("#") symbol) The first time I use the makefile, I remove the
hash symbol, put a hash symbol at the beginning of line 8, and call make.

This will create a .lnk file, and then I put the hash symbol at line 9
and remove it from line 8.

I hope this helps. I'm doing this from the top of my head, so
if anythings is unclear feel free to ask.

Cross-posted to: uw.sys.atari,comp.sys.atari.8bit,comp.sys.atari.st,comp.sys.atari.st.tech

The Kitchener-Waterloo Eight Sixteen Thirty-two (KWEST) Atari user group,
has a separate 8-bit meeting and 16-bit meeting.
We meet monthly, have special interest groups (SIGs), associated bulletin
boards, public domain libraries, and a newsletter "The Hard Copy".

I am on the executive of the group
so I should be able to handle most questions or
get replies from the rest of executive.

The group welcomes new members and visitors with
8-bits, 16-bits, or those just curious.

Meetings held at the University of Waterloo in the
Math & Computer Building.

Rooms open at 7:00 pm. Meetings start at 7:30 pm.

Call 579-3695 for details.

Next Meetings
****

16-bit (ST) - Wednesday, Jan 9, 1991
DCS Course Room, Room 2009 (2nd floor)

Hope to see you there,
Dani Roloson

163. Re: Latest ST Xformer II = 2.55

Newsgroup: comp.sys.atari.st
Date: 1991-01-07 21:12:51 UTC
From: darekm@microsoft.UUCP
Message-ID: <60319@microsoft.UUCP>
Source record: 235867

```
VERSIONS OF ST XFORMER II
=========================

In response to the question about the latest version of Xformer, here is
a list of all release of ST Xformer II to date and what they do:

(for reference, ST Xformer 1.1 and 1.2 ran at 15% to 25% the speed of the
real Atari 800 and didn't support Atari DOS)

2.0 - released July 1988 - don't use it!

2.1 - released July 1988 - Atari 800 emulation, Apple II emulation
- Atari DOS 2.0 support
- this version is OK for running Atari 800 software
if you already have it ported to the ST disk
- a memory hog (uses over 800K)

2.2/2.3 - October 1988 - don't use it!

2.31 - November 1988 - support for the Xformer cable (big plus!!!!)
- 800XL emulation
- selectable 800/800XL emulation, slow or fast FP
- said by many to be the most stable/compatible version
- runs at about 40% to 45% the speed of a real 800XL
- requires less memory but more than 512K

2.4/2.5 - May 1989 - 130XE emulation
- uses much less memory (runs on 512K, just barely)
- supports up to 8 disk drives
- 8-bit hard disk emulation (on ST hard disk)
- runs at 45% to 50% the speed of real 130XE

2.55 - September 1989 - LATEST and GREATEST!

2.6 - spring of 1991 - even smaller memory requirements
- bug fixes
- 16 MHz support
- possible TT support (for FAST speed) if I ever get my
hands on a TT (hopefully this decade)

All of these versions of Xformer are up on various bulletin boards. But
people still complain they can't find them. So if you really need Xformer
badly, send me $10 and I will send you a disk with Xformer 2.31 and 2.55 and
if I have any left, an ST Xformer II User's Manual that includes such things
as the pinouts to the Xformer Cable. Last time I looked I had about a dozen
manuals left. And no, I do not make or sell Xformer Cables.
```

Question: does a 16MHz board help?
Answer: Yes, it boosts the speed by about 60%.

Question: does ST Xformer 2.55 run on the TT?
Answer: No. But when I figure out why, it will run at about 300% the speed of the Atari 800.

Question: Where do I get the disk and manual.
Answer: Send $10 to me at the address below. If you write a check, do not make it out to Branch Always Software since that is not a product. Make it out to me, Darek Mihocka.

Question: Where do I get a Xformer Cable?
Answer: Look in START or other magazines and look for ads from either BRE Software, First Stop Computers, or Innovative Concepts. I do not manufacture the cables or sell them and do not receive royalties from their sale, so please do not bother me about cable problems.

I will also be making available a public domain IBM PC version of Xformer that runs at about 50% speed on an XT, 100% on a 286, and 200%-500% on a 386 or 486, depending on clock speed. It is currently being tested by a few people and assuming Atari doesn't have a cow about people running Atari 800 software on a PS/2 or Compaq (or heaven forbid, an Atari PC-4), it will be up on the boards in a few months. The similar Apple II emulator will not <grin>.

I am impressed with Unlzh v1.72 (available from atari.archive). It is
very fast, and installs as an application quite nicely. I have yet to have
a problem extracting something with it.

Sort of. I saw an ad by Toad Computers that included prices and specs but said "Call for Availability". I didn't but if you want to call their phone number is (301)544-6943.

I have no connection with Toad Computers (but I like their Toad cartoon figure:^).

Tony,
Though I myself REALLY like this idea, (ala Macintosh), it goes back to bringing up the subject of (*yikes*) viruses. It WOULD however, provide easy updating, by simply putting out a new 'system' disk, (again, ala Macintosh). Atari must have had some valid reasons not to do this, but I can't think of any. Since they started out in one direction, it seems that they are stuck going in that replace-the-complete-ROM-set direction, though It's not NEARLY as cost effective, or easy to implement.
Before anyone starts arguing about speed considerations, let me say that I do program development on the Macintosh, (with a slower hard drive interface), and the delay in rebooting is not all that bad, especially considering programs like Pinhead for the ST. Also, if you're not in an environment that causes frequent reboots, the reboot speed of loading in such a RAM-based OS would be negligible.

Atari people: I know you're tired of seeing this type of message, but CAN you pass word to the people that make those type of R & D decisions to at least CONSIDER something like this?

I have ported dvi2tty to the ST, and I will be sending it to
comp.binaries.atari.st as soon as I figure out how to. dvi2tty prints
out a rough ASCII version of a .dvi file, for all you non-TeX users.
That still won't help with .texinfo files, but you can use Emacs to
read those.

Put a kernel OS with RAM jump-tables on the internal ROMS.
Add 128K of updates to the cartridge port.

Only problems are: What do you decide to put on the cart?
When do you release a new internal ROM?

171. Error P at FACCC2

Newsgroup: comp.sys.atari.st
Date: 1991-01-08 01:01:34 UTC
From: roulston@watserv1.waterloo.edu
Message-ID: <1991Jan8.010134.27556@watserv1.waterloo.edu>
Source record: 235882
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have just started to get an error when starting up certain
programs, specifically the Prospero Fortran workbech and associated
utilities....it says

Error P at FACCC2

when I click on the program icon (from Neodesk or not).
The executable is on my hard drive but I get the same error when I try
to run from floppy , only the error address is changed to

F9FC04.

My question is where is this address??? Is this a RAM error??? And if so,
why do all my other programs work (Uniterm, Tempus...).
Or is the address in the ROM?? I don't know where they are mapped. If it is
in the ROMS, could it be do to changing over to TOS1.4?? I don't remember if
I have tried this since I did the change.

Anyway, does anyone have any suggestions?

thanx,
james

176. ST software for sale

Newsgroup: comp.sys.atari.st
Date: 1991-01-08 04:48:02 UTC
From: arw@sage.cc.purdue.edu
Message-ID: <5581@sage.cc.purdue.edu>
Source record: 235887

I am interested in selling some of my ST software. I am selling this since I no longer own my ST (and haven't for quite some time). I am willing to sell the whole bundle, or just parts.

Falcon : $25.00
WordWriter ST: $25.00
Flight Sim II: $25.00
Gunship: $20.00

And, if you happen to be a pilot:

The Navigator 2.0 (an excellent flight planning program) for $25.00

All software comes with original documentation (and if you really want, I can probably produce the original packaging for most of it). Everything is in good shape. I would be willing to sell the first four items bundled together for $80. I would be willing to sell all five for $100. Prices are somewhat negotiable. Please contact me at my email address or by phone at (317) 743-9671. I will pay for shipping (as long as it is reasonable).

email : arw@sage.cc.purdue.edu -OR- xarw@purccvm.bitnet

The ST cart. port has only either 128KB or 256KB (forget exactly which one, but it's not infinite) space.
And TOS is already larger than 128KB (6 * 32KB = 192KB). Plus I want to be able to use the Spectre which is connected to Cart. port, and there is a few MIDI and music stuff is using cart. port.
Just my 2 cents.

this is one of my pet peeves, so skip this note if u don't want to hear
my ranting...

lharc has somehow become the defacto standard archiver for c.[bs].atari.st
and archives (like terminator) because it does a significantly better
job at compression than arc (at least arc 5.21 and earlier). fine. only
problem is that there are at least 3 different versions that i am aware
of and early lharc versions were very buggy at best (IMHO). in contrast,
the excellent zoo package has never been a problem on any system i have
used, from pc to cray (though the cray port was non-trivial :-). and it
is the standard archiver for c.b.ibm.pc (which generates much more traffic
than the st groups).

lharc is very flakey, though i have not gotten an newer unix version,
so it may have improved in the last 6 months so don't get on my case about
that. lharc is 1) slower than zoo (MY tim is valuable, i hope you think
yours is, too), 2) marginally better at packing (still not as good as
compress, of which there is a robust st version, and cost of floppy disk
is minimal), and 3) is not centrally maintained, as far as i can tell. it
is also not very common outside the usenet st community, from what i can see.

i can understand the maintainers of terminator for wanting to minimize
the disk space which they thoughtfully provide as a service for us, but
i really don't think the savings over zoo is (in total) much more than
5 to 10 percent, if that.

i just don't think that the savings gained from lharc is worth the hassles
(i.e. manhours lost) to justify its use, though i suppose it is futile at
this point to try and re-standardize on zoo (a better choice overall, IMHO).
and i do not know of any *significant* features which lharc has that zoo
does not have. i have to admit, though, that i have had few problems
with lharc for the past 6 months or so, so that the situation has improved
since lharc's initial appearance (which was a mess at best). i think it
originated in japan, though that is obviously not the reason for its
problems (there were too many people scrambling to get the ball rolling).
and i seem to remember versions of lharc being distributed in (if you can
believe this) .lzh files (sheesh! talk about a catch-22).

sorry i can't offer u any help. lharc is just not robust enough (far too
"delicate" if you ask me). perhaps the various factions maintaining it can
come to terms and collaborate so that this mess will eventually get

resolved. i believe there was a new version of lharc for unix posted to comp.sources.misc (which is archived on uunet.uu.net and elsewhere, if u have FTP access). u might give it a try.

one of the flakier aspects of lharc (at least the unix version i have) is illustrated by this scenario:

1) i generally unpack uuencoded files which i save from news with the same name as the arc/lzh/zoo file name, without the extension (i.e. if the archive is "xxx.lzh" i save the uuencoded file with name "xxx").
2) after uudecoding, i am left with files "xxx" and "xxx.lzh".
3) if i say "lharc v xxx" to make sure there is a readme file before i delete the original posted file (e.g. "xxx" in this example), lharc barfs, saying xxx is not an archive. it is not smart enuf to look for "xxx.lzh" unless i tell it to do so with "lharc v xxx.lzh". zoo, however IS smart enuf to append the proper .zoo suffix before it opens the archive. to be fair, i thing a) this is a trivial change (but i have to fix it myself, unless newer versions are so equipped), and b) i think arc has the same problem (don't quote me on that though).

note that everything i post is arc'd (5.21) to make sure anybody can read it, no matter what (tos/dos/unix/vms/etc)...

there, i feel MUCH better :-)

This is definitely not true. I have seen someone using EPROMs with no problems whatsoever. (It was Spectre 128, not a GCR but I think it will work with both). It is illegal to copy the ROMs, but it can be done...

Script is very appreciated in France and works really well. You
should also take a look to Script 2. It is distributed by the same company
(Application Systems ???) but it's not only a new release. It's a new prgm
compatible with the former one.

> These days archiving subdirs should be the DEFAULT.

Well, there's always the command line

zoo -restore archive.zoo

It's worked quite nicely for me.

The other 'flaw' I see with the various LHARC, LZH, UNLZH programs is this:

With the exception of ports like LHARC 0.5beta, et al, almost EVERY
single archiver/unarchiver using the LHARC protocols is ShareWare.
This bothers me, seeing that both ARC and ZOO were released as
free-of-cost software, and the original protocols for LHARC didn't
cost anything either. (I'm speaking non-commercially here, I'm well
aware of SEA's commercial charges for ARC, as an example.)

TOS 1.0 1.2 1.4 1.6 2.0 ; ROM systems and RAM systems ; DMA/SCSI ;
unability to upgrade easily a ST-computer from 1MB to 4MB ; no distribution of
the new TOS ; GDOS distribution ; hardware quality (remember Megafile 30 power
supplies pbs in Europe) ; where are Gem 3.0, GemDraw, GemWrite ?

I called Atari France some days ago and I asked the single question:

Me -"Will you sell the TT desktop for ST-series ?"
Atari -"No, we won't..."

I will never understand this. So stupid answer....

Ok. Was a little flame and I feel now less nervous. So, Mr Atari,could
you please reply to an Atari-fan ? And don't tell me I can have all this info
being an Official Developper...

1) COMPLETE description of ALL metafile functions ?
2) complete description of Gdos drivers *.SYS ?
3) will you distribute TT desktop (OFFICIAL answer PLEASE !) ?
4) is the TT control panel desk accessory free of distribution ?
5) what is the structure of the modules (CPX ?) for the TT control panel ?

Daniel

What you need is the program called detex. I know it is available on
Unix machines and it might be easy to port it to the ST. I don't know
if it uses awk or anything like that or if it is pure C source code.
Anyway, look in the various TeX archives for a program called detex.

cheers,

186. Re: Atari SH204 hostadapter with 'genuine' SCSI drives

Newsgroup: comp.sys.atari.st
Date: 1991-01-08 14:34:32 UTC
From: heiden@kboeng.enet.dec.com
Message-ID: <1991Jan8.152838@kboeng.enet.dec.com>
Source record: 235898

Some time ago I was asking for help:

In article <1990Dec10.110739@kboeng.enet.dec.com> heiden@kboeng.enet.dec.com \
(Matthias Heiden) writes:
>I would like to upgrade my original SH204 (with 20 MByte Tandon 262) with
>another drive. As far as I understand the hostadapter inside the SH204
>understands SCSI. Therefore I would like to connect it directly to a
>'genuine' SCSI drive instead of putting another MFM drive on the
>Adaptec 4000 SCSI -> MFM controller.
>Does anybody has experience with this solution ? What sort of problems
>could I run into ?
>Any help is appreciated.
>Thanks Matthias Heiden

This is now an intermediate summary of my attempt to get information
and practical experience of how to use the Atari SH204 hostadapter
with 'genuine' SCSI drives.
First, thanks to all who replied and provided useful information and
experience.

The basic answer to my question seems to be : YES, it can be done
... BUT
Here a selected collection of answers:

- From: ccicpg!paulm@uunet.uu.net (Paul Moreau)
[edited]
I have hooked a Maxtor XT-4380S , XT-4380E w/ Emulex SCSI->ESDI card,
a Wren 6 SCSI drive and a Cypher 540 SCSI cartridge tape drive to my
SH204 host adapter. I've only had problems with the Wren.

- From: duke!sam.cs.olemiss.edu!tacky.cs.olemiss.edu!tony@mcnc.org
(Tony Reynolds)
[edited]
Well, I can tell you that I have had nothing but failure with this.
I used two mechanisms, the ST-157N and ST-296N from Seagate. I can
make a ST-251-1 work fine (using HDX 3.01) but have never, despite
repeated attempts, succeeded in making a 'genuine' SCSI drive work.

- From: apratt@atari.UUCP (Allan Pratt)
[edited]
This works for some SH204's. However, the power supply in the SH204 is
not beefy enough for some drives. The only way to tell is to see if it
dies. Therefore this is not recommended practice. In addition, the
host adapter might have the "old" PAL, not the "new" one, which won't
return some errors from the SCSI controller. This bit me recently: the
"old" PAL didn't return "write protected" from my Syquest drive, and

boy was I confused! The writes seemed to work, but the cached
directory etc. didn't match what was actually on the disk.

The "old" PAL has the number 60AC on it. If the little board in your
SH204 has a chip with that number on it, it won't return some errors
from the drive. I don't know how to get the "new" PAL - maybe dealers
can order it. Since the SH204 is not in production any more, this
might be hard.

- From: fernwood!portal!cup.portal.com!Yonderboy@uunet.uu.net (Christopher
Lee Russell)
[edited]
I just bought the PAL chip meantioned for my Atari SH204. I purchased the
chip from B&C Computer here in Sunnyvale, CA. The number of B&C is
408-749-1003. I think I paid $20 for it... I decided it was worth the
insurance. You might want to try San Jose computer as well. I think you
can find there number in the Atari Mags......

- Now my own experience so far:

I tried with a Quantum P80S drive which was used before with a
Future Domain SCSI board on a PC system. From there I know that
it worked.
The power supply of my SH204 is rated at 2 Ampere, the P80S
consumes (according to spec.) at max 1.7.
My SH204 has the "old" PAL - but anyhow.
Using a single ended SCSI terminator at the P80S end, I got the drive
finally alive. Using RATEHD from ICD, I'm getting the following average
figures for my original and the Quantum setup:

Reported Setup Transfer Rate Access Time
SH204 Adapter with
Adaptec 4000 and ADAPTEC 5000 306 Kbyte/sec 106 msec
Tandon 262 - 20 MByte

SH204 Adapter with P80S 980-80-94xx 673 Kbyte/sec 28 msec
Quantum P80S

This is in fact quite impressive (:-).
By doing single sector reads, I can access 163545 sectors on the P80S
and read all the information which was originally written while in use
at the PC system. Spin down by software works as well.

Well, so far so good. BUT, although I can read, I did NOT succeed
until now to WRITE anything nor to get the drive REFORMATTED!
Trying to do so causes the drives's busy light to go on and stay on
forever (at least until I switch the drive off). Further attempts
to read/write/spin down ... leave me alone with "drive not responding"
or "drive not available - check cabling" messages etc. (:-(.

Any further advise is very much appreciated.

Matthias Heiden

187. Sozobon

Newsgroup: comp.sys.atari.st

188. RS232 problem: Atari ST and JNT-PAD; any relevant experiences?

Newsgroup: comp.sys.atari.st
Date: 1991-01-08 15:24:01 UTC
From: ngse18@castle.ed.ac.uk
Message-ID: <7704@castle.ed.ac.uk>
Source record: 235953
Cross-posted to: uk.misc,comp.sys.atari.st

A colleague without Usenet access has been having problems with his ST attached to a Camtec JNT-PAD, as widely used on the UK JANET network. It seems that on at least two occasions recently, the Atari RS232 port and its partner on the PAD have blown simultaneously. The network folks claim the fault lies in the Atari, and are considering insisting that all Atari users fit an isolator. My colleague and I are a little surprised by this. Has anyone else had similar problems, heard similar claims or is otherwise able to comment?

Please respond by mail to e_pgr@uk.ac.nmh.va (JANET) e_pgr@va.nmh.ac.uk (Internet) or to myself. We will gladly summarize useful/interesting responses.

Russ Evans
British Geological Survey, Edinburgh e_gs18@va.nmh.ac.uk (Internet)

My colleague's account follows:

==========
Subject: Atari ST connection (via RS232) to PADs.

Trouble has been experienced here, to the extent that both the PAD and the Atari comms port have failed more or less together. This has happened twice within the space of about four months, after a period of perhaps four years when no such trouble was encountered.

At the moment we are not sure what the initiating failure is. One suggestion (from the computing service) is that when the Atari comms port driver chips fail (which, they say, is possible), they blow the driver chips in the PAD (by putting 24v down the PAD line). It is further suggested that Atari themselves know of this feature!

The end result has been the replacement of the failed chips on both the Atari and the PAD, when everything resumes normal service.

Can anyone cast any light on this perplexing problem?

Peter Robson
Edinburgh. [e_pgr@va.nmh.ac.uk]

>than the st groups).

zoo is the worst of the archivers I have seen in terms of compression ratios.
Not only that, but it's slower to unpack a zoo file than it is to
unpack an lzh file or an arc 6.x file. But the worst peroblem with
zoo is its brain-damaged syntax w.r.t. subdirectories. If you don't
unarc with zoo x// <file> then you don't get the tree structure, even
if it's archived. (Or is it zoo x\\ <file>? Or zoo x/ <file>?)
These days archiving subdirs should be the DEFAULT. Sounds easy
enough, but try sitting through 30 messages saying "Hey, your damn
software doesn't unarc right on my machine. What's the big idea?"
It's EASY to screw up un-zooing. Trust me.

If you use Jon Harris' unlzh.prg, it will automatically extract full
pathnames for you. Not that this is CRUCIAL if there are more than
113 files in the archive, since directories can only have 113 files
in them, max.

>lharc is very flakey, though i have not gotten an newer unix version,

>is minimal), and 3) is not centrally maintained, as far as i can tell. it
>is also not very common outside the usenet st community, from what i can see.

Re: Your points:
1) It's slower than zoo to archive, but quicker to unarchive. Archiving
only has to be done once. Since most people (in fact, all except one)
will be UNpacking, it's safe to say that to save "valuable time" we
should minmize UNpacking time.
2) I wouldn't say "marginally better". The HacMan II distribution (+700K)
compressed to 257K with LHarc and 335K with zoo. This is not
ideosyncratic; I saw similar ratios when I was trying to decide what
archiver to use for software distribution. Zoo came in last place

consistently. (Vs. Lharc and Arc 6.x)
3) Well, Jon Harris's GEM-based unlzh-er (quite excellent) was reviewed in Shareware Connection, so it's made it that far. I think it's silly to say that only usenet types use it. Besides that, you can make self-extracting LZH archives, so it really doesn't matter if people have unlzhers or not. You don't need one to extract SFX archives.

>i just don't think that the savings gained from lharc is worth the hassles
>(i.e. manhours lost) to justify its use, though i suppose it is futile at

>problems [...]

Look, zoo is worse than arc 6, so why would you want to standardize to zoo, of all things? You'd be better off using tar and compress. (I'm serious there.) There are perfectly stable versions of LHarc on atari.archive. I've never had problems with LHarc. I would strongly suggest NOT switching to Zoo, although I am not dead set on LHarc. I just don't see why it's getting such bad press.

>sorry i can't offer u any help. lharc is just not robust enough (far too
>"delicate" if you ask me). perhaps the various factions maintaining it can

You just said you haven't had problems in the last 6 months! That's robust enough, isn't it? So you had problems with the BETA versions. Big surprise! Well, it's not BETA anymore, and it works fine now. What's the problem?!

> 3) if i say "lharc v xxx" to make sure there is a readme file

I suggest you get a more recent version of Lharc. I compiled it (the one on atari.archive) for Ultrix and it has no such problem. This is NOT an inherenet flaw in Lharc, and certainly has NOTHING TO DO with the LZH protocol.

Lharc has somehow become the defacto standard archiver here because it
is the form people upload in. I do not have the time to unpack everything
and then repack it. If you would like to do so, be my guest. I've found
that often people upload a .zoo and someone else will come along and
upload a .lzh version of the same thing. The lharc'd is almost always
significantly smaller. In a world where we fight for disk space, smaller
is better, as it means we will continue to be able to keep the archive here.

Lharc for unix is flakey, this is true. I use unlzh11.arc (from archivers)
on my ST and have never had problems. If someone has a good copy of
lharc for unix, please send me a copy. (Mike, I'll send you one too :))

Close one to call here. I don't have any figures (yet), but I'd dare
to say it's a bit more significant than that.

I agree, when I first started using lharc I could never get the damn thing to
work. I have little to no problems with it now. All of our archivers
are easily unpackable from either arc or zoo. Later versions, which I
find easily ignored, are kept lharc'd; again, I don't have the time.

[stuff about where to look for a new version deleted, along with a
scenario that lharc 'flakes' out in]
>
>note that everything i post is arc'd (5.21) to make sure anybody can read

Thanks, Bill. It makes me feel better when people who download stuff
upload stuff back. Again, the point is I don't care what format it comes
in as. It will stay that way. Lharc has a huge following here because
my uploaders like lharc.

>

From: bcullign@vax1.tcd.ie
Message-ID: <1991Jan8.174544.7427@vax1.tcd.ie>
Source record: 235877

Could someone tell me how to program the DMA and the Floppy Disk Controller (FDC) on a 520STFM? Any info would be appreciated.

Thanks in advance.

From a posting by Dan Moore:

The most reliable way to contact Gadgets is phone (voice or
fax), unfortunately that isn't a cheap option. Next best is GEnie,
in the Gadgets roundtable. Usually you will get a response the same day,
occasionally it may take two or three. Next best is either email to
the well (...!hplabs!well!dsmall or dsmall@well.uucp) or to gadgets
(...!boulder.Colorado.EDU!tcr!gadgets!dsmall). Neither of those is
very reliable, one has machine problems and they both have problems with
replies (I can't always send mail from tcr or gadgets to my work machine,
and I'm SUPPOSED to know what I'm doing ;-).

Later he wrote:

Gadgets' connection to the net was unreliable for a couple of months
due to hardware problems with the system that they talk to (tcr). And then
Gadgets changed computers (from a AT&T 7300 to a Japanese 68030 box) which
added even more problems. Things seem to be working fine now. You should
be able to email them at:

{big site}!boulder.Colorado.EDU!tcr!gadgets!dsmall

or

{big site}!hplabs!well!dsmall

Dan Moore
AT&T Bell Labs
Denver
dlm@druwy.ATT.COM

I have never gotten an answer from Gadgets when using their UUCP (or
Internet) addresses - I won't speculate on why, but there is a way to
email them reliably. Use the Compuserve gateway, it definitely works.
Here's the "From" line on the answer I got from Doug Wheeler, use this
address to contact Gadgets.

From: Gadgets by Small <76004.2136@CompuServe.COM>

Gadgets may also use another account, which is a different number. I noticed it on the newsletter, it has a leading 7, a few 0s and lots of 6s in it (is Gadgets "Beastly"?!! 8-) 8-).

To email to Compuserve, substitute a period for the comma in the Compuserve id number and add "@compuserve.com", just as it is shown above (caps are unimportant). To get a reply, tell the compuserve person to email you at: ">internet:user@host.domain". For example, my address from compuserve is: >internet:pegram@griffin.uvm.edu
Lastly, there is no extra charge for either party, it is normal mail for the internet and for Compuserve.

Hope this helps people. Maybe this sort of thing should go into the monthly Intro as it is a FAQ. At least the compuserve gateway stuff should be better known.

cheers (temporarily borrowed from Chris M. 8-)

Bob Pegram

pegram@griffin.uvm.edu
or
uunet!uvm-gen!pegram

P.S. (thought that was a .sig did you?) "uunet" or "uunet.uu.net" (BEWARE, I may have misremembered this last variation) is a good {big site} if you have to UUCP. 8-) RBPIII

sslee@polyslo.CalPoly.EDU (Steven Lee) asks:

>Is there a program that will let you
>download in the background or is the program Shadow (if it's still
>selling) my only option?

There's a program called Interlink ST that has background downloading via a companion accessory. I have used this program for over a year and I there's a caveat or two about what "background" downloading means for this program. It's supposed to mean you can start a download, exit the program, and go run any GEM application. So right away note that you can't run any archiver program or less or anything like that. But my experience is that it's pretty dicey even using GEM applications, like LDW Power or First Word Plus. I've given up on trying to do such things and have restricted myself to using the Interlink program while downloading. At least you can read stuff in the capture buffer and access the file selector, etc.

I don't know what the status of Interlink is, except that it's been a long time since there was an upgrade and the company closed it's GEnie account. Based on that, I'd seriously look at STalker, since it is actively supported.

Let me add to the discussion and say LZH is the best compression algorithym I have ever come across. I have had ZERO programs unlzhing files. However, once when I LZH'd a file it was a bad archive. don't ask me how.. But now I test my LZHives in UNLZH 1.7 before uploading to make sure that the LZH is good. Every time it is. I think I made a small error using it that first time which caused an error.

LZH compacts the best. Until a ZIP with the imploding comes along, we should stick with LZH. I think there is a LGS shell which supports LHarc, so if you can't understand a command line then try that.

UnLZH1.72 should be THE standard for extracting LZHives. It works cleanly and well. Try it, available on atari archive.

> Come to think of it, wasn't there a company that sold 4 meg ram
>drives that went into the cartridge port. Someone posting here a few
>months ago had one.

Yep, I have a 4 Meg Ultradisk from Alpha Systems. Alpha Systems doesn't make
these any more, nor do they seem to be supporting them with new software.
It's a pity, because this thing is really handy. Plugs into the cartridge
port, has its own NiCd battery backup and an external power supply - completely
non-volatile reset-survivable RAMdisk. My gripes - the autoboot code stopped
working with TOS 1.4, and it doesn't seem to work on my STe - boot-up says it
only has 32K of RAM installed. (!!!) Apparently when the ST is powered up the
cartridge draws power from the ST and the STe isn't feeding enough current
out the cartridge port to power all 4Meg of RAMs in the cart. Big drag.

But it *is* a nice fast system. Writes are somewhat slow because of the way
that's fudged, but for reads you bank-switch in 64K at a time. No transfer
delays to speak of - literally lightning fast access. I wish they would
reconsider and resurrect this product, or something similar. Maybe something
with larger capacity hanging off the DMA port, so Spectre users could use
it as well. It'd be slower, but more flexible. RAM is cheap enough now, I
could go for a 16 meg battery-backed DMA port RAMdisk/cache.

I have a 1meg cartridge RAM disk. You could put almost any amount
of memory on a cartridge. You are elimited only by the cost. The problem
doing this is, that you need a special software driver to access it. With
anything 128k or less, the Atari can access the memory (ROM) as if it were
internal ROM. To put more than 128k ROM on the port, you would have to
have SOME code in internal ROM that knew how to read the cartridge port.

>zoo is the worst of the archivers I have seen in terms of compression ratios.

zoo is not worse than arc 5.21, which is far and away the most popular micro computer archiver on the planet, i suspect (probably because it has been around so long).

the best archive system i know of for now and probably the moderate future is compressed tar files, though this is obviously geared for unix. still, unix IS begining to dominate the computer world as the OS of choice, at least for small systems and will continue to do so for a long time, i suspect. and there are excellent versions of both GNU tar and compress 4.3 available for the st now.

> But the worst peroblem with
>zoo is its brain-damaged syntax w.r.t. subdirectories. If you don't
>unarc with zoo x// <file> then you don't get the tree structure, even

i have no trouble with zoo x.// archive at all. and u un-zoo zoo files :-)

>If you use Jon Harris' unlzh.prg, it will automatically extract full

is there a unix/vms/whatever version of this? i want to look at it BEFORE i take the (excruciating) time to download it to my ST.

>pathnames for you. Not that this is CRUCIAL if there are more than
>113 files in the archive, since directories can only have 113 files
>in them, max.

does zoo have this file limit restriction? i KNOW tar does not...

>Re: Your points:
>1) It's slower than zoo to archive, but quicker to unarchive. Archiving
> only has to be done once. Since most people (in fact, all except one)
> will be UNpacking, it's safe to say that to save "valuable time" we
> should minmize UNpacking time.

what? i am constantly making archives. but then i am a programmer with like 10+ MB or source (archived) on my hard disk. one application alone that i have written for the st is over 1.6 MB (that is just the source code). i suspect "most people" DO create archives and that, at least for those of us that do, PACKING time is just as significant as unpacking, probably more so, in fact, since we do more packing than unpacking. and those of us who write the software you use (for free), should at least be heard.

>2) I wouldn't say "marginally better". The HacMan II distribution (+700K)
> compressed to 257K with LHarc and 335K with zoo. This is not
> ideosyncratic; I saw similar ratios when I was trying to decide what
> archiver to use for software distribution. Zoo came in last place
> consistently. (Vs. Lharc and Arc 6.x)

i performed similar tests on a variety of file sizes/types and found that
lharc was 5-10% smaller, but 50% slower (or more :-() at creating the
archives.

i buy bulk disks for $0.80 each. that means a savings of $0.04 to $0.08
per disk. if it takes 1 minute longer to CREATE an 700k archive using
lharc, then somebody making $20/hr has lost $0.33 in TIME. for 100 disks
that is a net loss of at least $25 or over 1 hr of time vs a savings of
$4 on disks. i am sorry, but i personally value MY time more than the
few pennies i save on disks. and i think it takes more than 1 min longer
to lharc vs zoo or arc 5.21. i don't recall testing arc 6.x.
i have not even attempted to add in a cost for the "aggravation factor"
waiting for lharc to finish its lethargy...

> Besides that, you can
> make self-extracting LZH archives, so it really doesn't matter if
> people have unlzhers or not.

NO, NO, NO, NO!!!

i don't like the idea of self extracting archives because it just makes
it more likely to pick up a virus this way. and i can't unpack one of these
on any other system than an ST, so it is extremely non-portable. i often
use source posted to other groups on both unix and st. if they post
self extracting archives for their machines (i.e. mac or amiga), there is
no way to unpack these without the machine. a GIANT leap BACKWARDS in
open systems and portability and sharing of software.

PLEASE DO NOT ADVOCATE THIS!!!!

note that the amiga news groups have standardized on shar files for
source (including uuencoded binaries in shar files). minix is more of
a hodgepodge, but generally shar or uuencoded compressed tar files.
but then they are not restricted to 8+3 file names. ibm binaries group
uses zoo (and there a HECK of alot more of those around than STs). i
ignore mac stuff (they use binhex or some other less attractive scheme).
i think the amiga guys are closest to my concept of ideal, which is more
like unix than msdos. funny, i always thought one of the big attractions
for the ST is that very early on it was possible to make it at least
look like unix. and if u complain that u do not use unix (now), i can
only say that within a few years, you WILL be using it. so why not get
on track now?

>Look, zoo is worse than arc 6, so why would you want to standardize to
>zoo, of all things?

how is it "worse"? and i did not suggest standardizing on zoo at this point.
please consider ALL aspects of archiving, not just size. that is stupid.

zoo handles directories (not as cleanly as i would want, either, so don't think i am advocating zoo, really).

> You'd be better off using tar and compress.

excellent idea. i keep tons of stuff (100's of MB) this way under unix. and some things on my st as well.

the big problem is dealing with the name of the archive (extension) because of tos. but tos compress tries to do a rational job by using "z" as the last char of the extension. this does not help when u have a unix file like "whatever.tar.Z", which must be renamed to (say) "whatever.tz". hence u always run into a problem with the name.

>(I am serious there.)

so am i...

>There are perfectly stable versions of LHarc on
>atari.archive.

i don't care about stable versions of lharc on the ST. i need a decent version for unix. the one i have is still somewhat flakey (IMHO) compared to the unix version of zoo. i need to be able to look at the archive and scan the documentation BEFORE i decide to download the megabytes of files just to see if i want it or not. i get news at work, not via uucp at home.

and as i mentioned, there is only one central source for zoo, not 2 or 3 (or more?) like lharc, which causes confusion at best. i could live with just one "official" version of lharc, if u could kindly arrange that. that includes lharc for unix, tos, msdos, vms, etc.

>I suggest you get a more recent version of Lharc. I compiled it
>(the one on atari.archive) for Ultrix and it has no such problem. This
>is NOT an inherenet flaw in Lharc, and certainly has NOTHING TO DO with
>the LZH protocol.

the lzh protocol is not the problem. the user interface is, however. i will, however, get src for the version u mention here are try it on my unix system to see if it is any better.

there are more things to consider than simply compression ratio (or even speed, for that matter) each time we change formats. if a new compression program was released say every 6 months, each time improving only the compression ratio, but changing file formats, would we change our standards every 6 months? i certainly hope not.

ok, enuf said on this topic. move along. maybe we can at least consider compressed tar files or compressed shar files as an alternative, though again it seems too late at this point. the problem with shar files is there are so many different types, so it would be difficult to do it (efficiently) without unix (or at least not without the raft of things that go into shar files, viz. sh/sed/cat/wc/test/echo/et al)...

I prefer using STalker with Shadow. STalker without Shadow has two limitations:

1. Background downloading only works if the foreground program is a GEM program. If you run a TOS program, background downloading stops.

2. Downloading is not reset-proof. If your computer locks you lose the download.

Using STalker with Shadow eliminates these two limitations. If you want to save memory, Shadow 1.1 lets you eliminate the big buffer. This removes the reset-proof download feature, but keeps the TOS background downloading.

Whose "compress" are you using? Lharc usually does at least 10% better than
tar/compress on all the systems I've used. To wit:

Xsun (the MIT X11R4 server, SPARC executable):
-rwx------ 1 koreth 811008 Jan 8 18:17 Xsun
-rw------- 1 koreth 499097 Jan 8 18:22 Xsun.Z
-rw------- 1 koreth 406469 Jan 8 18:17 Xsun.lzh

omega (a fantasy roleplaying game, source code only):
-rw------- 1 koreth 318708 Jan 8 18:33 omega.lzh
-rw------- 1 koreth 1081344 Nov 14 1989 omega.tar
-rw------- 1 koreth 389043 Nov 14 1989 omega.tar.Z

75dpi (the X11R4 75DPI font directory):
-rw------- 1 koreth 741754 Jan 8 18:41 75dpi.lzh
-rw------- 1 koreth 2703360 Jan 8 18:37 75dpi.tar
-rw------- 1 koreth 801720 Jan 8 18:39 75dpi.tar.Z

>i don't like the idea of self extracting archives because it just makes
>it more likely to pick up a virus this way. and i can't unpack one of these
>on any other system than an ST, so it is extremely non-portable.

Self-extracting lharc archives can be fiddled with with UNIX lharc, though
if you do much to them, they lose their self-extractingness (?). The virus
argument is somewhat valid -- after all, it is one more program you wouldn't
otherwise run -- but cautious users can still use lharc on its own to extract
suspicious archives.

Lharc/UNIX handles file ownership and permissions. I don't think this is
true of zoo. (The extra information is ignored on non-UNIX systems; there
is a field in the lharc headers which says, "I have extra information about
this file, and it's at this place in the header and is this long.")

>i don't care about stable versions of lharc on the ST. i need a decent
>version for unix. the one i have is still somewhat flakey (IMHO) compared
>to the unix version of zoo.

There was an excellent version of lharc on alt.sources not too long ago.
I can post it to comp.sources.atari.st if there's interest. It's the version
I use to repack stuff in the sources and binaries groups, and seems to
be compatible with all the ST versions in use nowadays.

>the problem with shar files is
>there are so many different types, so it would be difficult to do it
>(efficiently) without unix (or at least not without the raft of things
>that go into shar files, viz. sh/sed/cat/wc/test/echo/et al)...

Which is mostly the reason comp.sources.atari.st isn't in shar format any more. Shar files turned out to be less portable than uuencoded archives of various sorts. The vast majority of people who responded to my survey told me to get rid of the shar format.

Anyway, I thought it was important to inject some hard numbers into this argument. I think my examples are pretty typical of the sorts of things people are likely to compress. My opinion, in case it's not painfully obvious by now, is that lharc has enough advantages to warrant using it almost all the time (in fact, I use it instead of tar/compress to archive most of my UNIX sources.) I agree that it'd be nice if it were a bit faster, but you can't have everything. Not in version 1.0, anyway.

DCTRANDM was the fore-runner to SHADOW. There are several possible methods you can use: Stalker, SHADOW, and Masterlink. I don't seen anymore updates to SHADOW or Masterlink, so Stalker maybe the way to go for now. :-)

Re: Archiver Wars.

I've noticed Lharc1.2 is faster when you give it more memory. On
a friends one meg machine, it is noticably slower than on my 4 meg.
Has anyone compiled the unix source version to run under MiNT yet.
Then we wouldn't have to worry about speed.

I found that you need three or more different LHARC programs to
decode the files for the Atari ST in comp.binaries.atari.st and
at atari@atari.archive.umich.edu.

If it does not work with one, just try another one.
It is going to have the spirit of an adventure game... :-)

I would like to see only ARC, ZOO, or Z files.
There has never been any problem with these.

I wholeheartedly agree with this. I wish compressed tars were
standard. They always work, they're pretty small, and quick and easy
to extract. And, as you imply, most of the planet uses the combination.

>> But the worst peroblem with

>i have no trouble with zoo x.// archive at all. and u un-zoo zoo files :-)

No, I don't have problems, the people who try to unzoo my software do.
I would rather spend an hour fighting with an archiver than spend
an hour answering irate email, given the choice. (Of course,
"neither" would be nice, too.)

The whole point is that what is obvious to us "technical" folks
is NOT obvious to Joe User who just wants to play my game, which
is FREE by the way (since you make a point of that later on).

>

It's DOS (and therefore, for compatibility, TOS) that has the file
limit restriction. Only 113 files in a FAT. Or is it 112? In any
case, don't ask me why.

>

Well, I assure you I know what it's like to have tons of source
on the ol' hard drive. Your numbers are about the same as mine,
but I don't archive software except to distribute it or file it
away on a floppy or (these days) a syquest cart.

>i suspect "most people" DO create

What can I say? I doubt that non-programmers create archives that
often. But I obviously can't prove that. I don't think that just
because we write (free) software means we should force all the
Joe Users out there to put up with mediocre software that (for
whatever reason) is difficult to use, like Zoo.

>

>
>NO, NO, NO, NO!!!
>
>i don't like the idea of self extracting archives because it just makes
>it more likely to pick up a virus this way.

In the case of SFX, I don't see how this is relevant. It's not like
an "autoexec.bat" is stored in the archive, it just has a 3K hunk
of code to extract the archive from the appended LZH file data.
The self-extracting part doesn't have any special power. This is no
more prone to virus-spreading than any other form of archiving.

>and i can't unpack one of these
>on any other system than an ST, so it is extremely non-portable. i often

>open systems and portability and sharing of software.
>
>PLEASE DO NOT ADVOCATE THIS!!!!

That's a good point. For binaries that only run on an ST/TT I don't see that it makes any difference, but for (portable) source, etc. it's certainly imperative to maintain archive compatibility with the rest of the world.

>and if u complain that u do not use unix (now), i can
>only say that within a few years, you WILL be using it. so why not get
>on track now?

Like I said, I'm running LHarc under Ultrix. Many ST owners, however, don't use Unix and don't want to. Maybe the WILL learn the hard way that Unix is IT, but that doesn't change the current situation, which is that a lot of ST owners find Unix confusing and needlessly complex. (Heck, a lot of ST owners still don't want multitasking.)

>>Look, zoo is worse than arc 6, so why would you want to standardize to
>>zoo, of all things?
>
>how is it "worse"? and i did not suggest standardizing on zoo at this point.
>please consider ALL aspects of archiving, not just size. that is stupid.
>zoo handles directories (not as cleanly as i would want, either, so don't
>think i am advocating zoo, really).

Zoo is worse because it's slower, harder for Joe User to use, and doesn't compress files as well. If you have any other criteria for judging an archiver, I'd be glad to hear them.

>
>> You'd be better off using tar and compress.
>
>excellent idea. i keep tons of stuff (100's of MB) this way under unix.

As does most of the rest of the Unix world. The only problem with the tar.Z combination w.r.t. the ST is that 16-bit compress apparently requires a lot of memory to run. Since I have more than a meg, I don't have any personal experience with that problem, I've just heard about it.

>i don't care about stable versions of lharc on the ST. i need a decent
>version for unix. the one i have is still somewhat flakey (IMHO) compared
>to the unix version of zoo. i need to be able to look at the archive and
>scan the documentation BEFORE i decide to download the megabytes of files
>just to see if i want it or not. i get news at work, not via uucp at home.

I don't know; I got the Lharc source from atari.archive, compiled it under Ultrix, and use it all the time to preview stuff posted there before downloading anything. I've never had a problem with it.

>there are more things to consider than simply compression ratio (or even
>speed, for that matter) each time we change formats. if a new compression
>program was released say every 6 months, each time improving only the
>compression ratio, but changing file formats, would we change our standards
>every 6 months? i certainly hope not.

I agree.

>ok, enuf said on this topic. move along. maybe we can at least consider
>compressed tar files or compressed shar files as an alternative, though
>again it seems too late at this point. the problem with shar files is
>there are so many different types, so it would be difficult to do it
>(efficiently) without unix (or at least not without the raft of things
>that go into shar files, viz. sh/sed/cat/wc/test/echo/et al)...

The other problem is that many Atari owners seem to be quite isolated from
the Unix world. I'm not talking about Usenet folks, but rather the
people who have their ST's to do some word processing, play games, and
maybe some midi stuff -- the people that don't know dipsquat about Unix,
and will be completely confused by compressed shar files, and probably
files called "foo.tar.Z", for that matter. There are still ocassional
posts here asking what ".Z" files are, so clearly not everyone who
owns an ST is Unix-aware.

Problem with RS232 Drivers, These Drivers 1488 are a Industry Standard
and should not be a problem, there is one Problem that can cause these
to blow, is the Ground Potential, I don't think that the ST is eathed
this can cause a high static charge that can damage these IC's, this I
have found in Practice with other Equipment, So you could try a Ground
to the 0 Volts in the Power Supply, Note, the ST does not have 24 volts
so were did the 24 volts come from...only +- 12 volts...

Jari answers with the one variation on Gadget's Net addresses that I forgot:

> I asked this same question for a while ago, got masses of email
> containing addresses, but none of them had shown any marks of action
> yet. Maybe Mr. Small is too busy to answer?

> Try this: dsmall@well.sf.ca.us

> *** Jari Lehto, jartsu@otax.hut.fi, s37837k@saha.hut.fi ***

For more reasons as to why Gadgets doesn't always answer (besides
being busy 8-), see my earlier posting. I have gotten an answer by
using the Compuserve gateway, the accounts for Dave Small and Doug
Wheeler are respectively:

76606,666 <(haven't tried this, it's from the last newsletter, is it
missing a digit??)
76004,2136 <(this definitly has worked 8-)

To mail to Compuserve:

(using Doug as the example) the address is: 76004.2136@compuserve.com
(Note: substitute a period "." for the comma in the Id number)

To mail to the Internet from Compuserve:

(using me as the example) the address is: >internet:pegram@griffin.uvm.edu

There is no extra charge for either party. I don't think straight
UUCP addressing will work, you'll have to cast it into some form of
domain address like user@host.domain.

Note that both Compuserve addresses were publicized by Gadgets as
their official address.

216. Tos File limit was: Major Problems Unpacking 'lzh' Files

Newsgroup: comp.sys.atari.st
Date: 1991-01-09 18:01:33 UTC
From: pegram@kira.UUCP
Message-ID: <1991Jan9.180133.10001@uvm.edu>
Source record: 235965

From article <1991Jan9.090428.29529@wam.umd.edu>,
by dmb@wam.umd.edu (David M. Baggett):

Interesting and rather civil discussion of archivers:

One point though,
David writes:

> It's DOS (and therefore, for compatibility, TOS) that has the file
> limit restriction. Only 113 files in a FAT. Or is it 112? In any
> case, don't ask me why.

Um, I regularly have more than 113 files in a _SubDirectory_ the
problem only crops up with the _Root_ directory. It has to do with
the number of sectors reserved for the File Allocation Table. I
believe that MeSsDos floppies have fewer sectors reserved than
regularly formatted ST floppies (Note: the space set aside for the FAT
on floppies is configurable on several PD and shareware ST formatters,
hypercopy comes to mind as one). Also, this problem may not show up,
or may be at a much larger number of files for hard disk root
directories. Why subdirectories haven't got this problem, I don't
really know, it could be that they again have the problem with a
really *large* number of files.

Maybe a quick Dos - Tos disk format refresher is in order?

From: boyle@cunixf.cc.columbia.edu
Message-ID: <1991Jan9.202637.17431@cunixf.cc.columbia.edu>
Source record: 235970

Help! Being a new reader of this valuable newsgroup, I have missed all the helpful info of years past. I have an original 520 ST with TOS 1.0 on disk that I just recently unloaded from the closet to see if it was still alive. I obtained TOS 1.2 on ROM from a guy on this net, and it works, I think. I need some help and advice from y'all to determine if problems are the computer, the software or what.

- My demo disk came with Atai basic (not ST basic?), and it won't do all the graphics commands. There is no buffered graphics option.
- STwriter, junk, no manual, can you use this as a text editor?
- STTalk won't run
- Neochrome no good, I have a Monochrome monitor
- Ulima III, 4 bombs
- Others, get TOS error #35 (?)
- TOS 1.2 in ROM, where's my desk accessories? VT52, Control Panel?

Is my TOS right? Is it worth investing in games, languages, utilities, terminal programs? Will they even work? Ultima III didn't, CAD-3D won't run the animator...Is the single side floppy drive a joke? Is the double sided drive MS-Dos compatible? Or is it my 1/2 Meg RAM. I feel like advertising in rec.boats that I have a good anchor for sale.
I'd like to get a good C compiler and a Basic that works but should I just save my money for a 386, Mac IIsi or even a NeXTstation? I'm in a quandry.

Any help or advice will be appreciated.
John Boyle

bcullign@vax1.tcd.ie writes:
>Could someone tell me how to program the DMA and the Floppy Disk Controller
>(FDC) on a 520STFM? Any info would be appreciated.

You might get more help if you described what you're trying to do.

From me, you'll get advice on how to do it without directly programming
the DMA or FDC components of the system. Unless you're an operating
system, there's no reason that you need to talk to the DMA controller
or the FDC directly. If you're a developer, check your docs about the
Flop* and Rwabs BIOS calls. If you aren't, then become one so you can
find out about this stuff.

Well OPUS was NOT the culprit! I'm still not sure just what is.
Maybe someone knows what's wrong with this picture:

I have used the RAM disk program from the now defunct Compute's ST magazine for a long time - never any trouble with original 1040 TOS 1.0. I just got a Mega (TOS 1.2) - set up a 1.5M ramdisk, downloaded OPUS with Uniterm 2.0 (another long-used program) and un-arced it with arc6.03. Archive unpacks with no errors. I copy opus.arc to an archive disk. I run opus from the Ramdisk - voilla, it works - must have been a bad download before (he thinks). So I copy all the program files to a floppy and try to run from the floppy - same 2 or 4 bombs as before. Bad disk?? I format a new one, retrieve my opus.arc un-arc - about halfway through I get archive errors. Expletives deleted.

I download another copy of opus.arc - directly to floppy - do an archive test - OK. I start to un-arc - not enough room on disk for the last example spreadsheets. No problem (who needs samples) run opus - 2 bombs! Now I notice that some of the disk file sizes are different - many 0 bytes!

One last try - restart machine (with power switch) without ramdisk. Un-arc my saved copy with arc5.23 - everything works.

Does anyone know of incompatibility problems with TOS 1.2/Megas/arc6.03 and/or Compute's ramdisk program?

Sorry for the long post - but I feel better!

>limit restriction. Only 113 files in a FAT. Or is it 112? In any
>case, don't ask me why.

i thought this restriction was only for the root directory of a disk, not subdirectories. but my memory, as usual, is fuzzy, and i have no way right now of verifying this. i know u can have more than 113 files in a hd partition, though i can't be sure if u can have more than 113 files in total on a floppy, even if they are in directories. easy enuf to test, however.

are u saying that lharc has a restriction of 113 files in one of its directories because a user may potentially unpack it in the root dir and hence have problems? if that is the case, then all archivers will have the same problem. since i have not unpacked an archive in a root dir for years, i have never seen this. and i would guess that since most archives do not have this many files anyway (perhaps TeX fonts is an exception), this would probably rarely cause any problems. how does lharc deal with this? does it restrict u when creating the archive? and if so, is this also in the unix version? i have no idea how this works with arc/zoo either. just curious...

>>i performed similar tests on a variety of file sizes/types and found that
>>lharc was 5-10% smaller, but 50% slower (or more :-() at creating the
>>archives.
>
>I guess I'm just hallucinating, then.

no, dave, it just might be the files i tested and the date i tested them (when lharc just came out, like a year ago or so). i tried files ranging from 1k to 120k, text, programs (.ttp), and some binary files (16-bit sound samples). i thought it was reasonably comprehensive test, but it could have been an anomoly, from what i have seen you guys saying the last couple of days. it could also be that the compression itself improved from 0.62 (or whatever it was) to now. i do know, however, that no matter what file was compressed, it was REAL S-L-O-W at *packing*. i mean at least 2x slower. i distinctly remember lharc taking 6 min on a file that zoo did in around 2 min. still, it was a long time ago, so this is more of an impression than fact.

>>> [self-extracting archives are great]
>>
>>NO, NO, NO, NO!!!
>>

>>it more likely to pick up a virus this way.
>
>In the case of SFX, I don't see how this is relevant. It's not like
>an "autoexec.bat" is stored in the archive, it just has a 3K hunk
>of code to extract the archive from the appended LZH file data.
>The self-extracting part doesn't have any special power. This is no
>more prone to virus-spreading than any other form of archiving.

it is one more program to run, and extremely easy to fiddle with. from
what i know about these archives, it is just "cat unpacker archive >file".
is there any software to do checksums or compares on those 3k hunks? is
the source to that 3k hunk PD? it would make me feel a little safer
at least. i am reluctant to run any software i do not compile myself,
if at all possible. i can trust an archiver, but not necessarily a
self-extracting archive.

are there tools available to strip this thing off (yes, i just remembered
seeing one...never mind...).

>Like I said, I'm running LHarc under Ultrix. Many ST owners, however,
>don't use Unix and don't want to. Maybe the WILL learn the hard
>way that Unix is IT, but that doesn't change the current situation,
>which is that a lot of ST owners find Unix confusing and needlessly
>complex. (Heck, a lot of ST owners still don't want multitasking.)

well, maybe i am more of a unix bigot than i thought. also i like to
try and look to the future, rather than the here and now - another
thing that gets me in trouble :-).

>The other problem is that many Atari owners seem to be quite isolated from
>the Unix world. I'm not talking about Usenet folks, but rather the
>people who have their ST's to do some word processing, play games, and

agreed. but a well designed system will work no matter what knowledge
level a person may be at.

ok, ok, uncle. i'll quit my moaning on this and get the latest unix
version. i may even hack it up to my liking (yet another version!).

and i promise to broaden my scope to include non-technical people from
now on :-)...

adios...

226. switching res

Newsgroup: comp.sys.atari.st
Date: 1991-01-09 22:59:52 UTC
From: sslee@polyslo.CalPoly.EDU
Message-ID: <278ba068.35a3@petunia.CalPoly.EDU>
Source record: 235913

I didn't get much response the first time, so this is somewhat of a repost. Since it is confirmed that there is no legal way to switch res without going through the desktop, how would you do this illegally for my own personal use. This would be convenient to write low res programs while running in medium res (such as using Laser C). I have TOS 1.0 but I suppose I could check the TOS version and use differenct methods if necessary.

The only thing that remotely comes close to what I wanted was in a program called AVS.PRG (Audio-Visual Player by Jim Kent, released by STart). For example, if you were in medium res and wanted to be in low res...

```
char *ainit=(char *)a_init; /* Line A call, $A000 */
Setscreen(-1L,-1L,0);
*((int *)(aline-692))=319; /* Mouse X limit */
*((int *)(aline-690))=199; /* Mouse Y limit */
*((int *)(aline-666))=16; /* # of bitplanes */
```

Apparently, that works in setting the boundaries for moving the mouse cursor. It also shows the correct colors. Unfortunately, it does not center dialog boxes correctly, does not clear the area under the drop-down menus, and some VDI functions (such as drawing ellipses) do not work as expected.

I think I can trick GEM into changing res if I know where it stores the VDI parameters when it opens a virtual workstation.

Cross-posted to: comp.sys.atari.st,comp.sys.mac.wanted

I recently asked why Apple hasn't challenged Gadgets by Small in court, and I also asked why no-one talks about copying the 128K Mac ROMs with an EPROM burner. Many thanks to those who replied, and I apologize that your replies were too numerous to make personal repsonses practical.

In general, the replies I received are in agreement that Gadgets by Small (or whatever its previous incarnation was) has in fact been in touch with the folks at Apple, and some sort of deal was made such that G by S is free to market the Spectre so long as it can use only REAL Apple ROMs. Oh-- they also have to steer clear of infringing upon the Apple Macintosh trademark (no names like Mactari).

Fine, right? Well, I'm not sure how the Spectre software can detect true ROMs vs EPROMS-- anyone want to help me out on that? As well, one person told me that someone had indeed been charged for distributing pirated Mac ROMs, which implies that someone has a use for the things...

It was nice to hear everyone point out that duplicating the ROMs is an intolerable act of piracy, and that they didn't mind the slight expense of legal ROMs.

Hang on a bit, Mac 128k ROMs are 64k each or am I missing something. Spectre only addresses 128k on two chips, by a rather strange method (IMHO).
The myth of a security lock possibly originates with the Mac board layout, which requires some of the data lines to be swapped on the ROMs. This would cause an EPROM made from a ROM dump to fail. Anyone with their firmware on EPROM will be in for a shock some years later when the data falls off it (if they don't have the master ROMs handy), correct me if I'm wrong.

Is anyone out there in Netlack running STadel BBS?

1) I need help/advice about who to talk to to get into UUCP networks.

2) Have you always wanted to run SEE or Final Frontier? I've written a little program (<8K) that runs SEE and FF just fine on my 1MB machine. (there's only around 150K available when the programs are running, so this would only work on a 1MB machine or more.
I still don't know how to submit to any archives, so just email me, and I'll send you a uuencoded version.

(Wouldn't it be great if any of the STadel BBSes out there were local to the Dallas (214) area code? (grin))

From: acton@cs.ubc.ca
Message-ID: <1991Jan10.053427.22552@cs.ubc.ca>
Source record: 235985

I was wondering if anyone has a C compiler and linker setup to cross-compile on something like a Sun Sparc-4 for an Atari ST. I am in the situation where I have 2 1040s at home (no hard disks) and would like to do a little software development. I figure it is faster to do this on a machine like a Sun at school and then use a high speed modem to transfer the executable to a floppy on one machine for testing on the other. I thought that in the past someone had done this for the gnu cc compiler and if that was the case I was wondering where I might ftp the software from.

Thanks

Well, I seem to recall running into the 113 file limit when archiving (once again) HacMan II -- I couldn't have all the files in a single directory at once because there were more than 113. I tried to copy the whole mess into d:\usr\games\hacman2\dist\ (i.e., not a root directory) and got an error code (I forget the number) when gulam hit the 113th file or so.

I guess it could be gulam, or maybe I did something odd. I don't think any of the archivers themselves impose a restriction on # of files; I just meant that since you can't have more than 113 files in a single directory (under TOS), a potential standard archiver must be able to handle subdirs easily, otherwise we won't be able to archive things consisting of more than 112 files on all machines.

> . i distinctly remember lharc taking 6 min on
>a file that zoo did in around 2 min. still, it was a long time ago, so
>this is more of an impression than fact.

That time comparison sounds about right. There's simply no denying that LZH encoding takes considerably more CPU time than whatever methods Arc and Zoo employ. I don't know why this is since I haven't looked at the algorithms.

>.....

Yes - but *badly* ! Perhaps its the originators fault - I've never bothered to look - but it always makes the files owned by root. Great(?) if you're SU but naff if you're not. Luckily it causes me no problems - just hassle but I can imagine it could seriously inconvenience some (most?) users where they cannot use root access.

Lets remember we're talking about a PC type of archiver - UID means nothing here so why have it.

Personally I prefer zoo but it *does* have its problems. I have never encountered any with the unix version (& I use that to transport all my archives to my ST because of a problem with the FD program here) but the ST version refuses to compress some files (usually binary). In this case I use arc which copes competantly but with less compression.

John.

244. Re: Uniterm macro

Newsgroup: comp.sys.atari.st
Date: 1991-01-10 12:58:00 UTC
From: pv@polari.UUCP
Message-ID: <3119@polari.UUCP>
Source record: 235998

I'm including a macro here for use with Uniterm 2.0e that will run XYZ2.TTP from a function key and incorporates some automatic features to replace the ever tedious command line. Instructions for its use are contained within the macro when viewed with an editor or the way you're about to see it now. Other versions of XYZ.TTP can be run from this with very little editing. XYZ2 of course incorporates uploading ZMODEM as well as down. This feature is handled simply by the macro. Paths and files can be selected with a file selector, or ZMODEM download to the default directory will happen if you just press carriage return at the first prompt. Remove the portion before and including the line, make any necessary edits, and save the edited portion as "XYZ2.MAC" or whatever you like to use as an extention for your macros. Follow the instructions contained within the macro carefully and you'll have all your Zmodem transfers within Uniterm at a few key presses. The lines that start with "#" are comment lines and should be retained in the macro for future reference.

I think this utility combined with Uniterm makes all BBSing with this program fast and easy. Enjoy.
-Pv-
macro follows after next line

```
--------------------------------------------------------------------------------
# XYZ2.TTP up/download macro for Uniterm 2.0e.
# Use command "%macro('xyz2.mac')" (w/o quotes) on a function key to run.
# Make sure XYZ2.TTP and XYX2.MAC are in the default drive.
# You should have 50k or more space in your system buffer.
# This assumes you want to use XYZ for ZMODEM only. "-p" pause switch
# is always used. If default "dflt" is used, XYZ will download to the
# same drive as it was run from. You might want to edit lines 5 and 10
# to change the default filesector drive. Change the C: between the '' to
# whatever you want. Do not add spaces or "\" marks if you do not specify
# a folder. Add a folder by using: "C:\stuff\".
# The next line is line 1
me('XYZ2.TTP ZMODEM. Cancel=option prompts')
if(inp('Enter <RET> for dflt dnload or Cancel')) run('xyz.ttp','-p/r/n') ex( )
if(!inp('Enter <RET> for dwnld, <CAN> for upld')) ju(1)

246. Upgrading ST memory with Mac memory

Newsgroup: comp.sys.atari.st
Date: 1991-01-10 13:58:29 UTC
From: smisra@eos.ncsu.edu
Message-ID: <1991Jan10.135829.26782@ncsuvx.ncsu.edu>
Source record: 236000

I recently upgraded my Mac to 2.5 Megs, which involved
the removal of two of the previous chips and were
replaced by two 1 meg chips. Now I have two chips
that I think add up to .5 Meg...can these be used
to upgrade my 520ST (without the internal floppy) to
1 Meg?? Any tips are appreciated!

>
>Maybe a quick Dos - Tos disk format refresher is in order?

A Dos/Tos disk is divided up into several fixed-sized regions: boot
sector, FAT (2 copies, actually), root directory, and data. The sizes
of these regions are determined when the disk is formatted and can
differ from disk to disk. The FAT must be big enough to hold the
entries describing the allocation of clusters in the data region;
beyond that, bigger isn't better. The root directory on a floppy is
typically 7 sectors, which is big enough for 112 entries. On a hard
disk, the root directory is often made considerably larger.
Subdirectories are stored like files in the data region and can be any
length. That's why the size restriction doesn't apply to them.

As I don't trust dealers, could anyone tell me whether I can run Sublogics (Microsoft) Flight-Simulator II on my STE (with a hi-res mono monitor). If I can't, could you suggest any alternatives ?

Thanks in advance !

249. Powermonger on Atari ST

Newsgroup: comp.sys.atari.st
Date: 1991-01-10 14:57:48 UTC
From: exspes@gdr.bath.ac.uk
Message-ID: <1991Jan10.145748.6580@gdr.bath.ac.uk>
Source record: 235904
Cross-posted to: rec.games.misc,comp.sys.atari.st

I'm having problems with the new Bullfrog game, Powermonger, on the Atari ST. Basically, it pays no attention at all to the mouse (which also means that I can't actually even start the game). I've swapped the disk at the shop, thinking it was a bad copy, but the second copy is exactly the same.

Anyone else seen this? My suspicion is that it is related to the system version. Both the STs I've tried it on have the very first version of the TOS ROMs. (To help verify that suspicion, does anyone have an ST copy of this that DOES work?)

I rang the Electronic Arts (UK distributor) tech support number, and got a not-too-helpful 'Gosh, we haven't heard about that problem'.

From: rcd@cbnewsj.att.com
Message-ID: <1991Jan10.174709.12862@cbnewsj.att.com>
Source record: 235906

I don't know about anonymous FTP, but a good source for PD Pagestream fonts is BRE Software (1-800-347-6760).

They have at least a half dozen disks chock full of Pagestream fonts like Chancery, Century Schoolbook, Lucida, Futura Extra Bold Condensed, etc. The disks are $4.00 each, but if you order 5 or more, they're $3.49 each.

Hope this helps. I have no affiliation with BRE software.

...which is, I can't seem to copy files from my UNIX account here
at school to my computer at home. Admittedly, I'm not very good at this
sort of thing yet, but there must be an (easy) way that I haven't tried
to do this. I have FLASH, and I've got a friend's copy of INTERLINK,
but no docs. I tried logging on to my account, and using INTERLINK's
XMODEM option to 'RECEIVE' a file, but it keeps trying to do so from
my ATARI disk drive. So, what's the mystery?
Some helpful information: my account is on a UNIX-based system
(a SUN, to be precise), but I also have access to a VAX account, so
I could ftp to the VAX if transfer is easier there. The VAX account
has its own phone number, but the SUN requires an extension. Yes, I
have logged on from home, so I'm not completely hopeless (just marginally
incompetent).

Ah that's it, and it's worth repeating, clearly I should have talked
about the size of the root directory rather than of the FAT.
Hypercopy does allow you to format with user specified root directory
sizes, helping the problem on floppies, as I mentioned in my earlier
posting. Still, that leaves David Baggett's problem under Gulaam.
Anybody know what gives with that shell?

>

The 64K roms used the Intel 2764 type Eprom or equivalent Rom.
In the Intel design, there pin 1 was used to control programming an Eprom;
Gnd for programming, +5 for usage. The Intel ROM (2564) required (allowed)
pin 1 to be grounded. The result was that an Eprom couldn't be used unless
you knew to lift pin 1.

The 128K roms used by Intel are 27128 (or maybe 27256) Eprom or equivalent
rom. These use pin 1 for an address line so the roms and eproms have the
exact same pin outs.

Yes, Mac switched around 5 lines (2 in one; 3 in the other) making up
the full 16 bit word being accessed. The Spectre cartridge rearranges
them to make them read correctly. (This really makes using the S cartridge
for other roms exciting and the bits have to be rearranged in software).

A Rom programmer will not care how the bits were rearranged when the original
was made, it only makes a 1:1 clone. However, there are many programmers
that will NOT allow a ROM to be read (to prevent cloning!). Thats when the
Spectre cartridge is useful in reading the Rom into memory; then producing
a data file such a programmer will accept. This is the convenient way
to patch TOS ROMS.

As has been pointed out earlier, one does not say they are making a copy
of thus and such ROMS (or software). What is done and used in your own
house is really your business. The nasties come about when these copies
are freely available to "friends" or are being sold.

Most of my work into reading ROMS dealt with copying both TOS 1.2 and 1.4
into 27512 EPROMS so that I could check out product compatibility. I own
the sources and run my copies instead.

258. Re: Max of 113 files in a subdirectory: fact or fiction?

Newsgroup: comp.sys.atari.st
Date: 1991-01-10 19:56:06 UTC
From: apratt@atari.UUCP
Message-ID: <2804@atari.UUCP>
Source record: 235915

GEMDOS imposes no limits to the number of files you can have in a subdirectory. The only limit is disk space: the directory file itself needs to grow as more files are added to it. Under some versions of TOS, the Desktop will not show more than N files in one folder, but that's a Desktop limit, not a GEMDOS limit. Gulam might also gag if it finds a large number of files in a directory, or if it's asked to copy a large number of files, but I have not had that problem, and I've used it to copy large numbers of files (>1000 total, >100 in some directories).

Root directories do have a limited number of slots for files; this number is fixed at the time you format the disk. It's often 128 or so.

> *((int *)(aline-666))=16; /* # of bitplanes */

Setscreen() fills in the line-A variable space with correct values for
the new resolution, so you don't have to do it yourself. This is the
right way to change rez, if you want to do that. Since you already know
you're going "behind AES's back" in doing this, I won't lecture you on
the implications. As long as you Setscreen() back to the old rez
before you make any AES calls, this works.

If you have a floppy drive in a SPARCstation you can write directly to an
ST-readable floppy. The gnu stuff on atari.archive has makefiles for use as
a cross-compiler as well as running native on Minix and TOS.

261. Summary: Transferring files from a NeXT CubeFloppy to a MegaST-2

Newsgroup: comp.sys.atari.st
Date: 1991-01-10 20:30:45 UTC
From: waynem@oakhill.UUCP
Message-ID: <4443@oakhill.UUCP>
Source record: 235918

Summary: Transferring files from a NeXT CubeFloppy to a MegaST-2

From hugh@redvax ("D. Hugh Redelmeier")
[1] warns against confusing TOS and DOS formats
I knew about this one. Another note is with DC Formatter you can write
the MS-DOS boot sector on disks other that 9-sector/track 80 track
formats. The NeXT (in this case) did not recognize the extended format
even though the disk contained a good MS-DOS boot sector.
[2] FAT corruption from like serial numbers on DOS formatted disks
Again, I know about this caveat.
[3] viruses on the ST
I checked for viruses and found none.

From Graham Thomas <grahamt@syma.sussex.ac.uk>
[1] warns about FAT corruption problems because of lacking unique disk IDs.
I knew about this one... See number 1 above.
[2] says "The best IBM-compatible formatter I know is Moshe Braner's
IBMFMT (version 101, NOT v1.0 if that's still floating about anywhere)."
I don't have this and did not see it at atari (terminator)

From allaudin@concour.cs.concordia.ca
[1] suggests trying to format with tos 1.04 1.06/1.062 or tos 3.1.
I only have access to the ROMs which came with my system.

From gatech!prism!tb8@cs.utexas.edu (T. Terrell Banks)
[1] says he had a similar problem which truned out to be a virus on his ST
and once the virus had be removed, there was no problem.
I checked for viruses and found none.

From ATARI Computer Enthusiasts <uhnix1!uace0@moe.rice.edu> (Keith Gerdes DC)
(DC = Double Click Software)
[1] says they will be updating DC Format probably 1Q91 and to let him know
what they can do on their end.
Hi! and thanks Keith. DC Format did the trick.

What really happened:

When I first tried to transfer files, I was formatting High Density disks
on my ST (which in and of itself is fine). However, the CubeFloppy on the
NeXT assumed the disk was formatted HD (1.44M) and not 720K. It declared
the disks as an unrecognized format. (it did not check the actual magnetic
media for the denisty).

After figuring this out, I formatted normal generic (you get the picture)
disks with DC Formatter and wrote the MS-DOS boot sector. This solved the
problem for me.

One thing I did notice was disks formatted on the NeXT were sometimes hard on my ST's disk drive (grinding sounds and other unpleasant noises were sometimes observed).

I would like to thank everyone who responded.

Also, I would like to apologize for the multiple posts of my original message. Our mailer software told me it was unable to send the message. So I tried sending it from other machines on the network until the mailer stopped complaining. Obviously, it sent it each time.

-Wayne

>>enuf to test, however.
>

The limitation of 112 files is restricted to the number of files in the root directory of a floppy disk. The root directory of an ST floppy typically occupies 7 sectors and each directory entry takes 32 bytes so 7*512/32 = 112 maximum number of directory entries. The root directory of hard disks typically occupy 16 sectors yeilding a maximum of 256 root directory entries. These numbers could be increased or decreased with a custom formatter but are usually sufficient for most users.

There is no restriction(subject of course to the available disk space) to the number directory entries in a subdirectory. However, some TOS versions can only display and access from the desktop(or file selector) a limited number of files. The additional files are really there and can be accessed normally through shells such as Gulam or Neodesk which allows you to augment TOS's limited display capability.

264. Wanted: PC-Ditto I Help (the software version)

Newsgroup: comp.sys.atari.st
Date: 1991-01-10 20:55:59 UTC
From: cwilliam@mimsy.umd.edu
Message-ID: <CWILLIAM.91Jan10155559@mimsy.umd.edu>
Source record: 235921
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have been trying to get my original PC-Ditto software emulator working. Since Avant-Garde is out of business, can someone help me?

I have an ICD host adaptor, Quantum 80MB SCSI drive, and a standard Mega 2 ST. I am using IBM PC-DOS version 3.30 and PC-Ditto version 3.00. TOS 1.4 is installed.

I have gotten PC-Ditto to run, it recognizes 4 partitions on the hard drive (from the initial screen), I insert a DOS 3.30 floppy, which successfully boots and I am faced by an A> prompt. HOWEVER, when I attempt to FORMAT C: /S as requested it gives a divide by zero error. When I do an FDISK I get another divide by zero error. Help me!

I have cleared out the C: partition (0) on my hard disk and would like to install DOS on there. I have removed everything from this first partition and in the meantime I am unable to use my hard drive. Does anyone know what the "divide by zero" error message is coming from?

Blitzkrieg ('tanks in advance),
Chris

Oops, I didn't mean to give the impression that Ultrix is an ST OS; it's not. It's running on the DecStations here and I assume it is a DEC product. It's basically like BSD Unix. I don't know the techincal details w.r.t. differences between Ultrix and Berkeley Unix.

> Still, that leaves David Baggett's problem under Gulaam.
>Anybody know what gives with that shell?

I can see this is how rumors get started. In trying to duplicate
my problem, I realized that I have 141 files in one of my
directories and Gulam doesn't seem to mind, so I highly doubt
Gulam has any difficulties dealing with more than 112 files. In fact,
I think what I did was copy the files into a RAMdisk first, then copy
them into a subdirectory. Since I was copying into the root
directory of the ramdisk, only the first 112 copied successfully.

In other words "Dave Baggett's problem under Gulam" was Dave Baggett. :-)

ljdickey ]

Only after gawk2.11 was posted in comp.sys.atari.binaries I become
aware of a bug in PML floating point library used on ST by gcc
compiler. This causes that gawk built-in atan2() is incorrect. Its
arguments are switched and sometimes it complains about precision loss
when there is none. As long as you know that this is more bother than
a problem. If it is really troublesome for you then you will have to
recompile with corrected libraries, I guess. I do not plan to post
new executables before next version of gawk will appear.

BTW - this bug in PML is already fixed and Jwahar Bammi has new
sources. Unfortunately it will take some time before changes will
percolate everywhere. Since nobody reported it for a looong time I
guess that this is not a show stopper. :-)

NTOMCZAK at UALTAVM
NTOMCZAK%UALTAVM.bitnet@ugw.utcs.utoronto.ca
ljdickey ]

The recently posted szadb 1.2 debugger seems to have a slightly
different opinion than gcc about what constitutes a command line
and where to look for it. To help to restore overall sanity I am
using a key definiton file similar to the following one. If you
are gcc user you may try that to.

---------------------------/ cut here /------------------------------
#
# A sample adb key definion file for gcc compiled programs.
# Use as follows 'adb -k fixargs.adb <debugee> [remaining args...]'
#
F1 $k11; $k13 ; $k14; $k15; $b; :c; main:d
#
# <sp,10/x instructions in two following commands mostly
# for demonstration and reassurance purposes.
#
F11 main:b <sp,10/x; $k12
#
# Magic numbers 3 and c below refer to a number of pointers to
# arguments to skip, i.e 'adb -k fixargs.adb'. Adjust as needed.
#
F12 <sp/W *(<sp+4)-3; <sp+4/W *(<sp+8)+c; <sp,10/x
#
# Replace by your desired breakpoints. They do not have to be
# all defined - even if referenced in F1.
#
F13 getitime:b
F14 getctime:b
#F15 localtim:b
---------------------------/ cut here /------------------------------

To use that file start szadb with a command line like in a comment
above. Of course you better have a symbol table. When you will get
adb prompt hit F1 function key followed by <Return>. Watch results.
The next <Return> will carry you to your first breakpoint (provided
you did not set it up ouside of an execution path :-)).
```

Enjoy,
Michal Jaegermann

From: ekrimen@ecst.csuchico.edu
Message-ID: <1991Jan11.062002.27944@ecst.csuchico.edu>
Source record: 235928

I recently discovered that in order to use the Audio Sculpture demo (AUDIO.LZH), which was posted about a month ago to atari.archive, on US machines, you must change the screen to 50Hz. Therefore, I have just sent 50HZBOOT.PRG to atari.archive. Put it in the AUTO folder of a disk (other than the Audio Sculpture demo disk) and follow the directions.

>When I do an FDISK I get another divide by zero error. Help me!
>[...]

Formatting your hard drive was major overkill. You don't need to
do that to install DOS on it.

Just type "SYS C:" and that will copy all the system files. I think
that should be enough to get you booted. I think SYS also modifies the
boot sector so that DOS can boot off of it. Either way, once you've done
that you could just copy your DOS files to drive C: (you could even do the
copying from the desktop if you wanted) and that's all it takes.

Formatting your hard drive is a lot to sacrifice to get DOS on
the hard drive. Heck, just having DOS take up the space is a waste! :-)

I don't know about the rest of your problems. Wish I could help.
Good luck.

273. bison

Newsgroup: comp.sys.atari.st
Date: 1991-01-11 09:04:41 UTC
From: tellabs_canada@canrem.uucp
Message-ID: <199111.1113.4573@canrem.uucp>
Source record: 235930

Many thanks to those who posted and emailed about makefiles for Lattice C. I've managed to modify the make utility supplied with Laser C to suit Lattice. Essentially, the makefile looks like this:

```
.SUFFIXES .o .c
.c.o:
$(CC) $(CFLAGS) $<
foo.ttp: foo.o bar.o
clink from c.o foo.o bar.o to foo.ttp lib lc.lib batch
```

The only disappointing thing about this setup is that you _may_ have to be careful that your compiler options match the startup code (ie. c.o) and libraries (ie. lc.lib) you supply.

And now, onto other problems. I have half of the duo of flex and bison up and running on my ST. Flex runs consistently without incident, but bison gives me a buss error whenever and from wherever I run it.

My machine is an unmodified 1040STf with TOS1.4 installed, I'm running QUICKST and GDOS with a Megafile 20.

Anyone have any ideas?

Thanks in advance
Mark

The limit of 112 files with LZH, well one of these Programs has a switch
for 500 files, also Disks can be formated far greater than the 112 limit
I have seen a German formater that lets you set the Directory limits
I use Usenet but do have any access here in NZ. for the SHAR/TAR and Z
I do find ZOO a bit of a problem and also LZH, ARC 602 is very good
but from what I here ZIP would be the Fastest, but then again we don't
have that, unless you bye the DCUTILS, so Please don't SHAR,TAR or
compress any Binary files, we here in NZ could never get them, even the
uudecode that I use was writen by the Sysop of the Unix System that I am
using, so Please think of the many others that use Usenet that are not
Unix mad, I for one can't stand it :-)...

No, there is no limit of 112 to the number of files in a directory -
it's the GEM desktop that refuses to display more than that number. It seems
that it reads the filenames into a buffer and sorts them to display by name
(or type or size or date).

There is one big problem with this setup Apple has made, and it will probabaly result in a lot of rom copying going on. Apple has reciently put a crack-down on mac roms. There is now, no how, totaly impossible to get them now. You can not buy them from delears, simply because the delears can no longer order them for stock. The parts polocy has changed, and all mac roms are now EXCHANGE ONLY!

Failure to send back an exact rom for one thats orderd results in a $500 sur charge to the delear per rom!

I know this because I am a apple service technician, it used to be possible to order most any mac rom for $40 each, but now they are exchange only, no stock!

It has one of the best Kermit I have been using, nicely integrated into the
emulator ...

uniterm is one of the best piece of software you can get. I use it since
4 years (various revisions), and never had a bit of problems. The tek4010
emulation is very usefull too, as is history recording, saving and printing.
For that, I use it also as console for a microvax II and vax 780. You can
also define 30 80*characters strings associated with the F1-F10, shift and
control keys, start-up macros etc.

4 years ago I was looking for a cheap+good vt200/tek4010 compatible terminal.
We found the atari 1040ST + uniterm the best we could get. We now have 25
of them, and are still very happy, even if the 1040 were not as reliable as
first thought (but up to now easy to repare).

I hope you will enjoy uniterm as much as we did!

[roberson@aurs01.uucp writes ...]

> Is anyone running pathalias on their ST? I'm looking for a way to
> handle the UUCP maps on my ST running Rodney's UUCP Modules. If
> no one is running it on their ST, how about on a PC?

Pathalias takes the UUCP map listings (see comp.maps.uucp) and outputs a ``paths'' file that helps a smart mailer, such as smail, transform addresses and otherwise-invalid UUCP paths into valid UUCP paths. It sucks memory like crazy and, for a variety of reasons, it's not worth porting to the ST (or PC).

You should be able to find a cooperative UUCP neighbor running Un*x who can run pathalias for you if you really need its output. Even without pathalias' output, you can hand-construct a paths file that will properly route most of your mail -- if you have a mailer that can use it.

I didn't think Rodney's UUCP modules could make much use of a paths file. I've only briefly looked at the package, but I was under the impression that it did not include a ``smart'' mailer. If that is the case, then you should simply hand all off-site mail to a cooperative neighbor who can perform address resolution and routing for you.

I run smail 2.5, which is a very smart mailer, on my ST. (I apologize for its unavailability; that's beyond my control.) Even though I can use the output of pathalias, I don't. I have a hand-constructed paths file that describes my neighbors and includes default rules for other sites. It does not, for instance, include an entry for atari.UUCP; if I send mail to that site it's simply handed to the smart-host for proper resolution.

Incidentally, I would like to appeal for sites that are not registered in the Domain Name System to do so. ``atari.UUCP'' and ``microsoft.UUCP'' are not reliable addresses because most sites, even most BIG sites, simply cannot maintain complete maps of UUCP connectivity. Many Internet sites simply refuse to handle the addresses that are not part of the DNS, including the .UUCP pseudo-domain. DNS registration costs as little as $35 and greatly improves your chances of getting your mail.

My paths file looks like this:

```
#
# me, myself and I

From: jharres@sleepy.bmd.trw.com
Message-ID: <1040.278d9c2d@sleepy.bmd.trw.com>
Source record: 235943

I've got a program called "Dollars and $ense" from Monogram Software that I recently dug out of the closet. It is version 1.1

1. Is Monogram Software still in business? If so, I need the phone number. The one in the manual is out of service.

2. Was there a version later than 1.1?

I can't get any reports to print. No instructions in manual other than data entry. It uses GDOS. I issue approprite commands to print from menu and the program goes off and calculates something forever. Mouse still moves, screen does not change.

3. If there is a later version, Monogram is out of business, and somebody has the latest version, I'd like to get a copy of it. I do have my original receipt to verify that I bought the version I have.

Thanks for any help that comes my way

I just got TOS 1.4 installed in my Mega 4ST. I know there are several patches to 1.4 (one of which is called poolfix). Where can I find these patches? I know about atari-archive (and I can get ftp access if I need it), but a quick look last night didn't turn up anything. Shouldn't they all be grouped together somewhere? I also know there were several versions of poolfix when it first came out. What is the latest version? Thanks for you help.

This is not meant to be a flame or anything. Merely a suggestion.

The only posted reply to this query of makefiles for Lattice C5 ST was the one I posted. But there were a few email replies. Is there a reason for this? I'm a bit of a techie and so I like to see what other people do in situations I find myself in occasionally. I don't mean to pry but I think this kind of thing is informative and useful.

Wouldn't this also be good to the signal-to-noise ratio in this group? Personally, I find that much more interesting than reading Atari bashing.

Source record: 235950

---
is there any inherent reason why future TOS versions can't be case sensitive, at least WRT file names (and directories)? i know that certain (perhaps old) compiler startup code forces upper case in several places (Fopen in GEMDOS may actually do this, or perhaps goofy GEMLIB/alcyon). i always found it strange that cpm, msdos, and tos could not deal with the difference between "a" and "A" in filenames, and have not been able to figure out a valid/necessary reason why the PC had taken a step backwards in this respect. i hope the answer isn't "tradition". and i hope the answer isn't that it would not fit in 192k...

the next logical question (to atari) is, if no real reason, is this planned (at least with the TT)?

i believe u said u were using lattice C.
if lattice is a 16-bit compiler (i.e. int is 16 bits), then that may be the source of the problem. it generally is for me (with other 16bit int compilers). probably the fastest workaround is to globally replace all ints with longs, but this can make the code unnecessarily large. do this only as a test.

note u can run gcc with 32-bit ints, often making it very easy (often trivial) to port unix code like bison. check it out, though it is rather large and u may have memory problems with only a 1040 (there are fixes for this, BTW).

From: chris@selenium.cchem.berkeley.edu
Message-ID: <10159@pasteur.Berkeley.EDU>
Source record: 235803

I have recently purchased a 40 meg Quantum SCSI drive (3.5"/half height.)
However, I still need to find a disk drive case/power supply and also a SCSI
interface for my 1040st. From what I hear, there are basically two interface
products available:

1) Berkeley Micro Systems (BMS200) ~$150. (Local atari store price)
2) ICD host adapter ~$110. (Local atari store price)

I've heard that the ICD adapter comes with excellent hard drive utilities
and that the BMS200 is poorly manufactured. Is this info. true?

As for the drive case/power supply, atari stores around here are selling
the case/power supply for about $150.00. Is it worth it? Has anyone out
there tried to "build" their own case/power supply? :-) What kind of power
ratings should the power suppy have?

Also, if anyone out there knows of any cheaper prices (i.e. via mailorder) for
SCSI interfaces and/or drive cases/power supplies, please let me know.

Any help is greatly appreciated.

Thanks,
-Chris Wong

The bison binaries in general distribution choke on carriage returns in
a text file. I have a new version almost ready which does not, and I
will probably post it to comp.binaries.atari.st in a week or two. Until
then, just strip the \r out of your files before running them through
bison. Good luck!

David

ps. I have posted MiNT versions of dvi2tty and less 97, and they should
be showing up in your comp.xxx.atari.st newsgroups as soon as these
things usually happen.

304. fonts

Newsgroup: comp.sys.atari.st
Date: 1991-01-12 16:47:45 UTC
From: meijer@nvpna1.prl.philips.nl
Message-ID: <meijer.663698865@nvpna1>
Source record: 235825

Hi, i am working at a program wat reads fonts and prints them
in a different format (for an ebeam). I made something that
almost works with the normal gdos fonts.

But, i find an displacement in the offset table and in the
bits. The algoritme that i use looks like this:

```
kar = kar - first_ade /* First entry in the offset table */
off = *(off_base + kar) /* The real offset in bits from the
beginning of the scanline */
p = base + off /* p points to the first byte in the
scanline */
```

You only have to add an offset for the specific bit in the x
and y direction, but that works. I only can't seem to find
the start of the specified character.

Does someone has a hint, or has an algoritme ?
btw. are there copyrights on these fonts, they where distributed
together with gemini.

Thanks.

305. BackupST limitations?

Newsgroup: comp.sys.atari.st
Date: 1991-01-12 17:23:10 UTC
From: dinapoli@rodan.acs.syr.edu
Message-ID: <1991Jan12.172310.25325@rodan.acs.syr.edu>
Source record: 235822

There's been some talk about BackupST over the past month or so, so I decided to try it out. Nice program! However I've had a problem with trying to backup my "fonts" directory for TeX. There are a lot of files in this one directory (and lots of subdirectories as I'm sure users of TeX know very well) and after scanning through the majority of them (calculating sizes) it doesn't seem to be able to open any more files. Upon returning to the desktop, the fonts directory appears to be empty. Sure enough, when I reboot, everything reappears. This behavior is similar to what you get when you get bitten by the folder limit bug. However I have the FOLDRXXX program and set it to FOLDR999. BackupST still had problems.

This is not a big inconvenience to me because I have the original .zoo files that the fonts came in. So there's really no reason to back them up all the time. Anyone else have a problem like this? I also tried to zoo the whole directory and it had problems too!

TYhe January/February 1991 issue of ATARI EXPLORER has an extensive article
on the internals of the Lynx. Fun reading for EE types, go grab a copy.

> I'm really impressed
>with the machine but I hope that Atari's support is better than they have
>with the ST and I don't get stuck with a machine with no available cartridges.

Lynx support is better than ST support (and I own both!), I think. There's
16 games out now, a bunch coming soon in the first quarter of '91, third-party
games on the horizon, and the recent COMDEX announcement of a smaller/cheaper
Lynx II ($99) and the price reduction of the Lynx ($149). If Atari drops the
ball with this machine, it'll be inexcusable.

I'm impressed with the machine, too.

309. rmgr works!

Newsgroup: comp.sys.atari.st
Date: 1991-01-12 20:15:07 UTC
From: david@doe.utoronto.ca
Message-ID: <1991Jan12.201507.8873@doe.utoronto.ca>
Source record: 235810

Howard Chu's rmgr is now working with my ST and a Sparcstation! rmgr does _not_ require mgr on the Unix machine, only on yours. Right now, I have two windows open talking to the SparcStation over my (1200 baud) modem, and two windows open to my ST. I just tried cutting and pasting between Sun and ST windows, and it worked fine. I don't know why I waited so long to try this out. It's like Unix windows, except that some of the windows can be open to your ST too.

To use rmgr, I wrote a simple (ie. REALLY simple) terminal program term.c to set up a terminal over the modem. To quit the program, you type ^]. You must set baud rate, etc, elsewhere. Here are the sources for the program. The binaries are only 1265 bytes on my machine (with optimisation, stripping symbol table, etc). Here is the source (I am posting it here because it is so small):

===== CUT HERE =====

```
/*************************************************************/
/* term.c: a _really_ simple terminal emulator */
/* by David Megginson, 1991 */
/* This program is released to the public domain */
/*************************************************************/

#include <osbind.h>
#include <mintbind.h>
#include <minimal.h>

#define QUIT 0x1d /* ^] to quit the terminal */
#define MAXWAIT 20000L /* Maximum number of failed attempts */
/* to read a character before we */
/* start snoozing */

main()
{
long counter = 0;
short c, found;

do{
/* We haven't found any activity yet */

found = 0;

/* Check for a character from the modem */

if( Bconstat(1) ) {
found = 1;
c = Bconin(1) & 0x7f;
```

```
Bconout(2,c);
}

/* Check for a character from the cons */

if( Bconstat(2) ) {
found = 1;
c = Bconin(2) & 0x7f;
if( c == QUIT )
break;
Bconout(1,c);
}

/* Don't soak up CPU time if there is */
/* nothing going on! */

if( found ) {
counter = 0L;
} else if( counter < MAXWAIT ) {
counter++;
} else {
Syield();
}

} while( 1 );

return 0;
}

/* end of term.c */

John Upham asks how to kill Rockpile Monsters in Dungeon Master...

The single easiest way is to use Poison Cloud spells (OH VEN). The monsters are very slow moving, and cannot get out of the cloud of poison very quickly. Step back a couple of steps and wait for them to move forward, then cast the spell.

To weaken them before you hit them with the poison, BEFORE they get up to you, throw everything you've got at them.. daggers, arrows, clubs, rocks from other dead monsters, whatever you've got.

Then when they're in the poison cloud, hit them with your weapons.

Note that they can still hit you if you stand right in front of you, but if you move back out of their way, they may escape from the poison cloud.

"Weaken Non-Material Beings" spells won't work against physical monsters.. ol "ghostly" types.

The spell for fireballs is FUL IR. You won't find the scroll for this spell until Level 7, but it's difficult to last that long without fireballs..!

313. Text editor accessory

Newsgroup: comp.sys.atari.st
Date: 1991-01-12 23:16:24 UTC
From: maf4003@summa.tamu.edu
Message-ID: <11218@helios.TAMU.EDU>
Source record: 235813

Hello to all from a Neophyte Usenetter!! It's great to be able to communicate and exchange info with other st-users. I want to be on the record as saying that the ST is the best computer around (for its price of course).

Now to my question: Does anyone know of a good text editor that can be used as a desktop accessory? I have TOS 1.2 on a 520stfm w/ 1meg of ram. It does not have to be loaded with options - I will be using it to edit configuration files primarily. I have tried spirit-ed by it seems to lock-up frequently.

Thanks for the help in advance.

Michael Fitch

314. moria problems

Newsgroup: comp.sys.atari.st
Date: 1991-01-12 23:28:37 UTC
From: maf4003@summa.tamu.edu
Message-ID: <11219@helios.TAMU.EDU>
Source record: 235814

Recently, I acquired and subsequently became addicted to the st-port of Moria (version 4.8? I think). It's a great game but the problem is that it is very flaky about executing - sometimes it works flawlessly the first time but frequently it appears to have loaded in properly (ie. the map is visible, etc) but after about 8-10 keystrokes (for movement) the whole thing locks-up. This is especially irritating because it takes 5-10 minutes to re-boot, recover char files, etc.
I am running it on a 520stfm w/ 1meg and TOS 1.2 with no desk access-ories or ram disk installed so I am completely baffled. Any suggestions or sim-ilar problems out there???

Adios,

Michael Fitch

Roman,

Check out the new issue of Atari Explorer (January/February 1991). It has
about 16 pages on the Lynx (half of which is on the internals and development
information). I also just read, from Z*Net, that about another 16 cartridges
are expected in either the first or second quarter this year, in addition to
the 16 already available. It actually looks encouraging (no wait, I didn't
just say that, did I?).

Macro fur using XYZ.TTP version 2.0 to up/download by pressing function key.
Script uses file selector and dialog boxes to make file selection fast and
easy. Two keypresses will download to default directory.
Macro begins after next line.

```
------------------CUT BEFORE AND INCLUDING THIS LINE----------------------
# XYZ2.TTP up/download macro for Uniterm 2.0e and XYZ.TTP version 2.0.
# Name this file to: XYZ2.MAC
# Use command: "%macro('xyz2.mac')" (w/o quotes) on a function key to run.
# Make sure XYZ.TTP (v 2.0 or higher) and XYX2.MAC are in default drive.
# You should have 50k or more space in your system buffer.
# This assumes you want to use XYZ for ZMODEM only. "-p" pause switch
# is always used. If default "dflt" is used, XYZ will download to the
# same drive as it was run from. You might want to edit lines 5 and 10
# to change the default filesector drive. Change the C: between the '' to
# whatever you want. Do not add spaces or "\" marks if you do not specify
# a folder. Add a folder by using: "C:\stuff\". Next line is line 1.
me('XYZ2.TTP ZMODEM. Cancel=option prompts')
if(inp('Enter <RET> for dflt dnload or Cancel')) run('xyz.ttp','-p/r/n') ex( )
if(!inp('Enter <RET> for dwnld, <CAN> for upld')) ju(1)
me('Select Destination for download. Cancel = quit')
w(10) if(!file('C:',' ','Select path for Dwnld')) exit( )
copy(1,'-p ') copy(2,$P) con($1,$2) con($T,'\r\n') copy(1,$T) ec($1)

Cross-posted to: comp.sys.atari.st,comp.music

My setup: 4MB TOS 1.4

ANybody have a configuration for SOFTLINK that works?
Linkedit tells me NOT ENOUGH MEMORY... even when
i use "SUGGESTED" and "FIT".

I have to create substantially smaller partitions
in order to even get SOFLTINK to load. ANd when i
run softlink, NOTATOR screen comes up.. mouse freezes..
Then i warmboot which puts me into partition 2...at
which time i can SHIFT # between partitions, with
the exception of partition 1.. which is always in
current state of busy bee or bomb...

How "virtual" are these partitions if you can't run GULAM
and TOGGLE between terminal and local?

Also, anyway to SAVE desktop configurations that can be autobooted
when initially running SOFTLINK? Or does one have to configure
a new desktop for each partition (if you want different setups)
every time you start a session?

I am pretty sure REVOLVER doesn't work with NOTATOR..
any other partitioning programs that can be suggested..

My preference is to get SOFTLINK to do the trick, as this
is why i installed 1.4 an hour ago.

-thanks

Is anyone out there using the Panasync C1391 monitor? If so, how do you have it hooked up and how does it look.

I have the spec sheets in front of me, and the ST's frequencies all fall within the specs of the monitor. Let me post here the specs for this and see what you multisync experts think.

Res: 1024x758 interlaced
Video amplifier bandwith : 30 MHz
Sync: Horizontal 15.5-36KHz, Vertical 40-80 Hz
Dot pitch: .31mm

I read an earlier message that stated the 30MHz bandwith was a problem with the ST. Other than that this seems like a good monitor. Any thoughts?

I can load xxx.son (226K file) .. select a track... (60 measures)..
play it back.. display the entire notation from beginning
to end. I CAN print up to 4-6 measures.. BUT if i request
to print entire track -60 measures.. the machine locks up.

I have removed MULTIDESK and NEODESK *.ACC's ...
makes no difference.

I copied the files to a backup, zeroed the partition..
recopied them etc.. NO difference...

Strange that i can load, play, and read (notation) the
entire file, but can't print it in its entirety.

Using and LQ800 Epson.

Ran NOTATOR from TOS 1.4 GEM desktop .. strangely, when i
hit the "e" key to go into the notation edit mode, the
machine draws a gray streak and locks up. Retry from
NEODESK.. no problems..

WOuld like to know that my last 3.5 months of work isn't
but corrupted NOTATOR files.. :-(

Where "someday" is "relatively soon", especially with the portable video game market getting crowded. Even at $150, the Lynx is a fun buy, with lots of neat gaming features the other systems don't offer.

>(By the way, has anyone actually *SEEN* all these 16 Lynx cartridges that

> the 113th file or so.

Hmmm ... i've got a lot of subdirs with 300, 400 or even 500 files. Neither GEMDOS nor the DeskTop (in ver 1.04) make any problem, there's no problem to use ARC to create an archive on all these files.

In earlier TOS versions the desktop had a limit of max. 395 files in all currently opened windows. Trying to show more was quite bomby...

GEMDOS should make any problems since subdirectories are stored like regular files (the entry with the name of the directory contains the # of the first data cluster, the rest is done via the FAT).

> I guess it could be gulam, or maybe I did something odd. I don't think

> consisting of more than 112 files on all machines.

Be careful when using Gulam!! If you enter a command line like

arc a arcname *.txt

and there are a lot of *.txt-files in your CWD, the arc utility receives a bad file list, since gulam tries to expand "*.txt". If this list is larger than 127 chars, you'll get a cmd line overflow (gulam doesn't care!).

arc a arcname '*.txt'

will do better in such cases.

Daniel

I have the same problem with PC-ditto on my ICD hard disk drive. I first thought it was due to having a C: partition too small. I've increased it to 6Mb and I still get the divide error whenever I try and access it (and this includes trying to SYS C:).

> I've seen a few copies of shadow still on the wall in local stores.
>(At least here we have local stores) I don't think Antic is shipping
>it or supporting it at all, in fact, of the 6 warranty cards I mailed
>to Antic during their heyday, I never received one newsletter, catalogue
>or any other ack.

In the January 1991 STart, Shadow is being offered for sale by Antic in
their 'Grab Bag' Promo.

So they are selling it still. I dunno about support. My copy works fine.

To put my feelings in on Shadow... I like it a lot and use it regularly.
It's been very bullet-proof, survives resets, and doesn't conflict with
other auto prgs or accs. Support of CompuServe B+ and YModem Batch are
nice features. I agree that an update to include ZModem could breath new
life into sales of the product.

Sure the door technique is useful, but you don't get all the experience.
I've found that having my people slash at nothing takes about 30 minutes for
them to gain a fighter level. However, their fighter level advances much
faster if I have them slash at monsters.

336. WORD PERFECT November 1, 1990

Newsgroup: comp.sys.atari.st
Date: 1991-01-14 00:56:31 UTC
From: seitz@netcom.UUCP
Message-ID: <20803@netcom.UUCP>
Source record: 235844

Just received a new release of WORD PERFECT dated Nov. 1, 1990. Here's the release notes:

WordPerfect 4.1 for the Atari ST (Nov 1, 1990 Release)

Some of the improvements that have been made to this version are as follows:

1. Support for the large screen monitors has been added. It has been tested on a Moniterm 1280x960 monochrome monitor and an Image Systems (ISAC Board) 1024x768 16 Color Board with a multisync color monitor. Any incompatibilities should be reported to our customer support dept.

2. Some RamDisk Software and other Desk Accessories would cause only the Directories to be seen in "List Files". This incompatibility has been remedied.

3. Better FSEL support has been added to correct display problems caused by using the System File Selector option.

4. The complete document path and name is now display in the window title bar.

5. The window positions and sizes are automatically saved when you exit WordPerfect. If this option is not desired then leave the window the full size and no change will be noticed. It is advised to reduce your window size on a large screen monitor to reduce the time it takes to update the screen.

6. If you are using a single floppy system and you should not use the drive B: option, due to a flaw in the System File Selector (FSEL), switching to disk B will confuse the system and possibly garbage your disk. Most third party file selectors don't seem to have this problem.

7. The LOOK option in List Files has been changed to use a window to be compatible to the large screen monitors.

8. Options that use a dialog at the bottom of the screen with the window resized now behave better when using the mouse.

9. Support for retrieving and saving IBM WordPerfect 4.2 files and IBM text files has been added to the menubar as "Import/Export" under "File" and the "Text In/Out" option (C-F5).

Print/Font Disks

Instead of just a Print disk and a Font disk, there are now 4
Print/Font disks with the printer defintions and font definitions
on the same disk. This should make printing a little easier with
not as much disk swapping for single drive users. We have
broken them down as follows:

Print/Font Disk 1
Dot Matrix, Daisy Wheel, Ink Jet Printers
Print/Font Disk 2
Laser Printers
Print/Font Disk 3
Postscript Printers
Print/Font Disk 4
Limited Support Printers

All of the utility programs (PRINTER.PRG, SPELLER.PRG, etc.) now
works with the large screen monitors.

>A scroll says use a spell for weakening immaterial beings. Does this
>mean once cast they are easier to kill or do i just keeep casting them
>til they expire ?

In my experience, it either works the first time or not at all. This spell
is very suited for the green ghosts on level 8 (and not on anything else that
I can find!).

>
>What do i need to cast fireballs ?

Just the right spell. One of the neat things about DM is that you can try
spells that seem to make sense (given the symbol descriptions), and they
will sometimes work. This is a perfect example.

>
>what are the most effective means of killing rock monsters ?

Run up to them, hit them a couple of times, and then back off. The fireball
spell is also nice.

Not true. I forget which level they're on, but there are water elementals
(at least, that's what they look like) which are impervious to everything
except vorpal blades and weaken non-material being spells. Also, the
fire elementals on the wizard level are also susceptible to both
the spell and the vorpal blade.

I forgot to mention that with the water and fire elementals, it
takes several powerful version of the weaken non-material being
spell (and/or attacks with the vorpal blade) to kill them.

About the Lynx internals, pick up a copy of Atari Explorer magazine
(Jan/Feb '91). It has an article about the Lynx internals. Sounds like
a nice little machine to program. Do you have an Amiga 2000 w/3MB RAM
to program it with (yes, that's its official developmen system.)

They are at the panarthea archive server as "volume8/rainbow" (pathes for
Rainbow TOS). They should be at atari.archive.umich.edu in the "Binaries"
directory under the same name (hopefully :-)).

IMHO, I think you'd be hard-pushed to beat HiSoft's FTL Modula-2.
The editor allows you to compile/link so you don't have to go through the
edit-save-quit-compile-link-crash(:-))-edit.. etc. Also, you get
a very comprehensive set of modules, along with source code. I own
the PC version (and made _EXTENSIVE_ use of it), and have also used the
ST version.

I can't comment on the competition, as I haven't used any of it !! `
(There is however a 'complete Modula-2 system' sitting on Lancaster
PDSOFT archive, which is fairly good - shareware, I believe. I think it's
called ANAMOD68.)

Hope this helps.

David Dawkins.

>
>Um, I regularly have more than 113 files in a _SubDirectory_ the
>problem only crops up with the _Root_ directory. It has to do with
>the number of sectors reserved for the File Allocation Table. I

Hello Robert!
You are nearly right. You can have 112 entrys in the root directory, because the formatters reserve normaly 7 sectors for the root directory on a floppy. This size is an entry in the bootsector. The number of sectors for the FATS has nothing to do with the number of files. It's size will be calculated so, that there is an entry for every cluster on the disk. As one can see the FAT size has nothing to do with the maximal number of files on the disk.

Greetings, Olaf

In article <1991Jan10.035158.234@actrix.gen.nz>,
Roger.Sheppard@bbs.actrix.gen.nz says:
>
>The one that is talked about a lot is the OMTI 55xx, don't know the
>full Part No. but they do 1:1 interleave with RLL,, From what I have
>read the Adaptec can't, get some info from ICD, as they use this
>Controller...
>

Hello,
I think the OMTI is a controller for a PC (correct me if I'm wrong), so
you can't use it with the ICD adaptor. Why aren't you buying a SCSI
harddisk from Seagate, Quantum, Maxtor or ... an connect it directly to
the ICD?
I'm using a Atari Megafile 30 which has a modified version of the
Adaptec 4070 and have no problems.

Greetings, Olaf

352. 1ST_WORD/1ST_WORD+ files header informations wanted

Newsgroup: comp.sys.atari.st
Date: 1991-01-14 12:23:41 UTC
From: hohr@cernvax.cern.ch
Message-ID: <3808@cernvax.cern.ch>
Source record: 235761

Hi netters!

I need to know the length of the headers of the .DOC files
created with 1ST_WORD and 1ST_WORD+. Is there a value that
tells me this length?

Thanks in advance.

Roger. hohr@cernvax.cern.ch

353. WANTED PC DITTO I SOFTWARE VERSION

Newsgroup: comp.sys.atari.st
Date: 1991-01-14 15:18:15 UTC

I would like to buy the software version of PC Ditto

Since the company has gone out of business, I expect that
market prices for this product are significantly lower.

let me know if you want to sell me one...I definately
would need the manual that came with the program

Saurabh

The following line caught my eye.

In article <20338@netcom.UUCP> seitz@netcom.UUCP (Matthew Seitz) writes:
|
| I prefer using STalker with Shadow. STalker without Shadow has two
| limitations:
|
| 1. Background downloading only works if the foreground program is a
| GEM program.
| If you run a TOS program, background downloading stops.

I have already noticed this before with other programs. Why does a
background running program stop when one runs a TOS program such as
GULAM, and not when one runs a GEM program? Can this be avoided?

I use FORMAT.ACC (Broddelformat) which unfortunately pauses when GULAM
is running, even if GULAM is just sitting there.

Thanks to all.

Has anyone else noticed a problem with the display of Notator 3.0?
I have what looks like a line of bad pixels running vertically
from the top of the main screen through the STOP button. It seems
to work OK, though.

The problem I am having is with the buffer record - when I use
Shift-Return to recall the buffer into an empty track all of the
notes that I have played are crammed into a short chord on the first
beat! My dealer will only say it "should work". Anyone else run into
this?

Dave

The Jan/Feb issue of Atari Explorer says TT TOS includes an exception-handler
in the BIOS that traps this error and replaces it with a move from CCR.
Apparently TOS ROMs are not the only software with this instruction.

(I don't know whether TOS 1.4 and 1.6 have this error-handling, or whether
they include the offending instruction.)

Hello,
I am trying to write a shell program (due to the idiosyncracies of gulam), and I have made several attempts to do input/output redirection with varying degrees of success. Please could someone out there tell me the 'proper' way to redirect IO before a pexec call (thinking in terms of a shell program). Do you have to preload the program, do the redirection, and then re-pexec, etc.

Please mail me any solutions, I will summarise to the net if necessary.
Thanks,
Andrew

In this list, games have been rated on a scale of 1 to 10, 10 being the best and 1 being the worst. For each game, the total number of votes, the average rating, and the vote distribution are shown. New games are indicated by a "*" before their entry. If a "(C)" appears after the title it means that the game is a CD-ROM or disc system title. If a "(J)" appears after the title it means that the game is currently only available in Japan.

The general guideline for ratings is:

8-10 worth buying at full price
6-7 worth buying at a discount, or if you're particularly interested in this kind of game
3-5 only worth renting
2 only worth playing for free, and only for a few minutes
1 worthless

The vote distribution uses a single character to represent the percentage of votes for each ranking. The following character codes can appear:

"." no votes cast "3" 30-39% of the votes "7" 70-79% of the votes
"0" 1-9% of the votes "4" 40-49% of the votes "8" 80-89% of the votes
"1" 10-19% of the votes "5" 50-59% of the votes "9" 90-99% of the votes
"2" 20-29% of the votes "6" 60-69% of the votes "*" 100% of the votes

Please consult the article entitled "ABOUT THE VIDEO GAME RATINGS REPORT" in the newsgroup rec.games.video for more details, including information on how to vote.

Questions, comments, problems, and errors should be directed to the list maintainer at either of the below addresses:

365. SOFTLINK really multitasks !

Newsgroup: comp.sys.atari.st
Date: 1991-01-14 18:15:17 UTC
From: ramsiri@blake.u.washington.edu
Message-ID: <14366@milton.u.washington.edu>
Source record: 235767
Cross-posted to: comp.sys.atari.st,comp.music

I thought this was pretty cool.

TOS 1.4 auto boots NEODESK, which autoboots
SOFTLINK which sets up three virtual
desktops and subsequently starts NOTATOR
in partition one. I start a sequence of
music playing in NOTATOR, and then, with
a key click, i enter partition 2, load
TEMPUS, and begin printing a file WHILE
i am hearing NOTATOR playing midi music,
then with another key click, i enter partition
3, load STalker from MULTIDESK and
put it in miniBBS mode... my friend calls
and logs on and runs GULAM remotely..
I was even able to run another NOTATOR
session launched from the TEMPUS editor.

I thought all this was pretty slick.
The environment is a bit fragile... FOr instance,
if you want to REMOVE a multidesk accessory, the
partiton bombs.. also, we haven't been able
to figure out how to get the command line shell
(gulam in this case) to work for the remote
user on his end .. doesn't seem to echo
to the remote user, but definitely runs gulam
and is displayed on the host.

366. Re: Uniterm 2.0f where to get?

Newsgroup: comp.sys.atari.st
Date: 1991-01-14 19:02:06 UTC
From: rrd@hpfcso.HP.COM
Message-ID: <7340060@hpfcso.HP.COM>
Source record: 235768

Thanks, Paul. I already have uniterm and I agree with you wholeheartedly that it's still the best terminal emulator around. However, the discussion here has drifted to STalker/STeno, and since I use my ST for program development on the HP48SX, I could really use a conbination datacomm/text editor program. That's why STalker/STeno sounded so neat.

I need the ENQ/ACK handshaking because I also use my ST via modem to call into work, and remote access requires ENQ/ACK. (It's a real abomination.)

So, again, re: STalker:

1) What handshaking does it support?
RTS/CTS
XON/XOFF
ENQ/ACK

2) Why not Kermit? Will future versions support Kermit?

Date: 1991-01-14 20:15:04 UTC
From: gulliet@rutile.enet.dec.com
Message-ID: <18926@shlump.nac.dec.com>
Source record: 235766

Hi,

I have just upload TeX 3.1 from atari.archive.umich.edu.

When I try to run it, it complains that it doesn't find
the plain file (TeX and plain.fmt are together in the same
folder, D:\tex).

How can I define the environment variables, like TEXINPUTS,
within GULAM ? The very short documentation says:

setenv TEXINPUTS ./:/dev/D/tex/texinput (!)

Regards,
/Jean_marc.

The easiest way to kill rock monsters is to keep slamming doors on them.
They seem mostly impervious to most other kinds of attack. I didn't find that
the poison spells seem to hurt them much. I will agree that anything

physical you can do to them is more effective. Even kicking and punching
works, if you're very quick and don't take more damage than you give.

>
> The spell for fireballs is FUL IR. You won't find the scroll for this spell

Fireballs are wonderful! Practice with these as much as possible; they
will become one of your best tricks.

The quick answer is this: GEMDOS was that way originally because MS-DOS is that way, and GEMDOS is still that way because it was that way originally.

There is little hope of a case-sensitive GEMDOS in the near future. If you're desperate, you can look up UNIXMODE from Bammi@cadence.com. I don't know if he has a stand-alone TSR version yet, or if it's still just part of libraries you have to link with to get it.

I received my new START (Jan?) this weekend, and it has a demo copy of Dr T's "Tiger Cub" sequencer. I have a stupid question that wasn't answered (I didn't find it) in the brief, on-disk documentation.

When you are in the track edit screen, how do you switch to editing another track? I can't find anything on either the edit screen or the record screen to control which track I edit when I edit.

So far I'm pretty impressed with this program. It seems much nicer than anything that was out in anywhere near this price when I bought my sequencer a couple of years ago.

Thanks for any help on the above stupid question, and any other general observations on this software.

SOFTLINK is a program that came with the update (2.2) to NOTATOR (currently at 3.0).. it is basically a RAM partitioning software that allows a certain amount of multi-tasking. For example, i can have NOTATOR playing music in the background while i am in another partition printing out a TEMPUS file.. or in another partition running STalker BBS etc.. as it is now, i cannot print NOTATOR files in the background.. when i swtich to another partition, the printing stops.. will resume when returning to the NOTATOR partition. Partitions switch immediately.. and so far, NEODESK and MULTIDESK work, though i have had some problems with figuring out the optimum memory allocation per partition. You can run SOFTLINK from your auto folder... and the desktops are set up at bootup time.. you can even have several softlink setups with whatever name you want.. load them via SUPERBOOT etc.. it would be nice if SOFTLINK stored your customized desktops per partition along with any accessories and autoload programs specific to each desktop (can have up to 9 partitions).

I am happy with this setup so far.. at least i can have a text editor in one partition sending text to a printer.. bounce over to NOTATOR and print out a score onto the same page.. go back to editor etc.. would be nice to have a score format that can be loaded into something like CALAMUS... maybe soon..

Hello, ST users...

I am looking for a 520 ST for sale, monitor not necessary, just the box.
Software is also not necessary, except for maybe one disk.

Anyway, if you or your friend is selling one E-mail me at the above
address. DO NOT post a followup here, because, since I don't own an Atari
ST yet, and I already read many newsgroups, I can't afford the time to page
through ST articles that I won't get anything out of. So anyway...

Please hurry, I want to buy it now before I spend my money on something
else. I will probably pay shipping if you need me to.

Thanks in Advance,
Sam

I think a lot of tos programs probably use Conin() to wait for input
and this would effectivly stop any background process that was Gem-based
from running. I think shadow works from the serial interupt, and therefor
can over-ride anything that doesn't set the IPL higher.

Stalker supports xon/xoff of rts/cts or both.

The other Q? I don't know the answer for that but here are some addresses. (Compuserve mail is availible through usenet too)

GEnie: E.ROSENQUIST
Bix: e_rosenquist
CompuServe: 72711,2503

PS an example of the utility STalker/STeno provide is that I am preparing this message in one DA STeno window and then ran STeno from the desktop to open the read.me that had the addresses I wanted to paste into this message. now I can send the whole thing to STalker and the net world w/a couple of keystrokes or mouse clicks.

PPS Another nice thing is that STeno used as a DA has a gem menu bar INSIDE its window. (and it always tries to show the full selections by not only dropping down but droppIng up (can I say that?) as well.

Yet another feature is that they can both be run as DAs or prgs off the desktop. Actually there are yet still more other features unmentioned AND STalker 3.x w/script language and other things will be out soon.

> background running program stop when one runs a TOS program such as
> GULAM, and not when one runs a GEM program? Can this be avoided?

Here's the deal: The ST basically has a single-tasking operating system. When a program is running, it has total control of the computer.

GEM adds a gross and clumsy sort of multitasking capability. A GEM program is ``event-driven'' -- it usually knows how to respond to any of many possible events, such as a keystroke, a drop-down menu selection, etc. To accomplish this, a GEM application tells the operating system what event(s) it may be interested in, and hands control to GEM.

Multitasking comes into play when GEM (actually the GEM AES Event Manager) has control of the system. It can dispatch event signals to more than one application. By cooperating, desk accessories can work in conjunction with primary applications. The DAs and the main program simply go to sleep (by calling the Event Manager) and wait for a ``wake-up call'' from GEM.

In addition to physical events like a keystroke, an application can wait for a ``timer event''. This makes it easy to write a desk accessory that performs uploading and downloading in the background. The DA calls the Event Manager frequently, letting it parcel out bits of time to other applications. When it is activated, the DA checks the ST's serial buffers and processes any data that is queued up.

But .TOS and .TTP applications such as Gulam, MicroEMACS, compilers, etc., aren't GEM applications, and they never hand control over to the Event Manager. They never ``go to sleep.'' If they want a keystroke, they don't bother with the Event Manager. Instead, they issue a direct call to the operating system that blocks other activity until it's satisfied. Therefore a DA such as STalker never has a chance to ``wake up'' and

process background data.

Fortunately, GEM isn't the only way to ``multitask'' under TOS. Another way is to take advantage of the ST's ``VBI queue,'' a list of routines that are executed every time the video display is redrawn -- about 60-70 times per second, depending on the monitor. VBI stands for Vertical Blank Interrupt.

VBI routines are a little harder to write, which is why you don't see many of them, but they work the same way: They're ``awakened'' repeatedly and they have to do a little bit of work, then voluntarily ``go to sleep'' so the system can proceed. There are programs that perform background file transfers, spool printer output, etc., using the vertical blank interrupt, and they will work happily in conjunction with a non-GEM application.

All the header lines start with hex 1F and end with a CR/LF pair. You
should be able to work it out from that. There is no length stored as such.

>within GULAM ? The very short documentation says:
>
> setenv TEXINPUTS ./:/dev/D/tex/texinput (!)

Gulam (or Mupfel for those using Gemini) will not like that
as the : cannot be used as a separator. Also / is not understood
in TOS. Assuming your files are D:\tex* then you use the command

setenv TEXINPUTS .,d:\tex
or
setenv TEXINPUTS ".;d:\tex"

Note the " in the second form to avoid the ; being taken as a command
separator.

A method I prefer is to set the environment independantly of the shell
I use. The prog is environ.prg which must be in \auto and the data
file is \environ.dat . In the data file I place (amongst others)

TEXINPUTS=.;d:\tex

environ is available on most archives.

GEM is multi-tasking (not in the unix way), TOS is not. As GEM does
not have a scheduler which is interrupt driven it relies on calls
to dispatch other processes. This gives the appearance of background
running where in effect the background tasks are only run when the
main application has made a GEM call (to get a char, update the screen etc)
A shell uses only TOS calls so this cannot happen - hence no background
tasks.

However having said that, I notice that Mupfel occasionally allows my
background clock to run.

John

Hate to jump into this long discussion but ...

In article <1991Jan8.154406.24146@terminator.cc.umich.edu> weiner@terminator.cc.umich.edu (Jeff Weiner) writes:
| Lharc for unix is flakey, this is true. I use unlzh11.arc (from archivers)
| on my ST and have never had problems. If someone has a good copy of
| lharc for unix, please send me a copy. (Mike, I'll send you one too :))

First of all, I am having better luck with LHarc on our Sun SPARC, than on my Mega ST at home. I usually test all archives before downloading, and I re-test again on my ST. I have never gotten *any* version of the UNLZH* programs to work. Even with all ACCs thrown out! I guess that UNLZH* must be doing something non-standard since this happens on French TOS 1.0 and 1.2.

I usually use LHarc 1.02 on my ST. Whatever it refuses (and that does happen!) gets sent to LHarc 1.13B (of course, it refuses files accepted by version 1.02), and even once I've had to use the binary patched version of LHarc 1.13 (I believe the B becomes an M) for one file!

SO, I AGREE WWHEN THEY SAY THAT LHARC IS FRAGILE!!!!

| >i can understand the maintainers of terminator for wanting to minimize
| >the disk space which they thoughtfully provide as a service for us, but
| >i really don't think the savings over zoo is (in total) much more than
| >5 to 10 percent, if that.
|
| Close one to call here. I don't have any figures (yet), but I'd dare
| to say it's a bit more significant than that.

Why not use the new ARC 6.02 (other than its 'Print' bug)? It's better than ZOO and its faster than LHarc. Unfortunately, it does *not* yet run under Unix, as far as I know.

Someday, when I have time I'll post the statistics that I have on the subject. COMPRESS together with TAR is a viable alternative for Atari STs.

Cheers,

A very powerful method for killing monsters is Hit'n'Run:

Hit the monster one or more times, run out of the monsters reaching, wait
until the monster tries to hit, cast or whatever, then return to the monster
and hit again.

This method is useful even for slow monster, e.g. rock monsters, knights,
screamers, ... and the dragon!

I suspect that the tradition goes back to CP/M and the use of teletypes.
But with CP/M it was easy to change -- there was a masking operation
that converted lower case to upper case, and I just changed that to NOP
(no-op) and had a full case sensitive cp/m. Interestingly enough,
Microsoft BASIC could create lower-case file names which could not then
be removed with CP/M commands!

With TOS in rom the hack would be harder, but since it is possible to
get all kinds of odd characters in file names by various errors, why
can't a case-sensitive version of TOS be generated?

>(calculating sizes) it doesn't seem to be able to open any more files.

>Anyone else have a problem like this? I also tried
>to zoo the whole directory and it had problems too!

Yep! Me too...but with Turtle. Turtle can't handle my d:\tex\fonts
directory. There is some bug in Turtle that I could never convince
George Woodside of its existence, also. Lately I've been gambling
because Turtle will not backup *either* of my two 10meg hd partitions
without bombing. I'm running TOS 1.0 or whatever (circa 1985) on
a 1040ST.

If BackupST can overcome the TeX font directory thing, I'll start using
it since Turtle won't work for me anymore.

cheers,
-chip

[remainder deleted]

Probably the best way to upgrade a Non-STE is with a device from:
EVESHAM MICROS, Unit 9, St. Richards Road, Evesham, Worcs., WR11 6XJ, UK
Tel: 01044-0386-765500

They sell a SIMM cage which can be inserted into any pre STE machine (so
their advert claims) allowing SIMM upgrades to 4 Meg. It is also claimed
to be solderless, and requires no electronics knowledge.

The latest price I have for it is about $120 with no installed memory
(from the Dec. 1990 issue of Atari ST User).

Red/. (borrowing jennie's account)

> When you are in the track edit screen, how do you switch to editing
> another track?

It's been a while since I've used Tiger Cub (I now use KCS with TIGER),
but as I recall, you change the track in the edit screen by clicking
on the arrow brackets on either side of the track number. Perhaps this
feature is not implemented on the demo version.

Yeah, it's a nice, powerful CHEAP program. I've made some pretty
complex music with it. Have you tried editing controllers with the
mouse? Gobs of fun...

There have been lots of discussions about multi tasking on the ST
lately. Anyone else checked out Dr.T's Multi Program Environment?
You can run as many Dr.T MPE modules as your memory will hold, and
easily switch between them. It gives them common access to all of the
sequencer arrays and parameters. The newest version of KCS (V4.0 or
"Omega") claims that it can load "any" program into MPE, but I have
not tried it yet. MPE probably isn't implemented on your demo, tho.

>and greatly improves your chances of getting your mail.

YES! YES! YES! Please do! If you're industrius you don't even have to
have UUNET do it for you and you can save the $35. However, the DNS
is the way of the future and it makes life *much* *much* nicer for
everybody! Go for it.

397. Bug in TOS 1.2 (maybe TT TOS?)

Newsgroup: comp.sys.atari.st
Date: 1991-01-15 14:41:40 UTC
From: adamd@rhi.hi.is
Message-ID: <2625@krafla.rhi.hi.is>
Source record: 235702

I just found a strange feature in TOS, by it's very presence in 1.2 there is a strong possibility that it hasn't been fixed in TT TOS either. If Drive A: is broken or disconnected and drive B: fully functional TOS gets rather confused about where the disk drives are. Say we boot the ST with only B: drive connected. (possible reasons: to get a quick boot off hard disk without waiting for drive A: to timeout, or to get almost instant "clean" boot on a system without hard disk, or to boot off a network without floppy boot overheads / disadvantages and yet retaining access to a local floppy drive).

What actually happens is this:
TOS notices that drive A: is missing and drive B: is present. Seeing only one drive the TOS figures that it must be drive A: and installs logical drives A: and B: to physical drive A: which does not exist. TOS still tries for 30 seconds to read drive A: and finally concludes that drive A: does not have a disk in it. (To agony aunt: Why is that timeout so long? If the disk isn't in the drive, what's the point in trying to read it?)
For comparison, if TOS finds no drives it is sensible enough not to try reading a missing drive until timeout.

Of course this faulty logic dates back to the early days of TOS and its predecessors, when RAM-loadable OS was in fashion (not that there's anything fundamentally wrong with RAM-based OS, mind you).

The most acceptable way of fixing this is (IMHO) to make a much better attempt at deciding whether a disk is in the drive being accessed (thus reducing timeout to absolute minimum, the main function of timeout being error recovery for a disk which is present but damaged), and to install both floppies onto physical drive B: if that is the setup.

This bug is probably seldom encountered, but is an unfortunate oversight. If fixed that would allow TOS to boot from logical drive A: whether installed on physical drive A: or B:. This would mean that if the internal drive fails for whatever reason, one could still continue to use a two-drive ST (without any modifications or repairs) as a one-drive ST (the same might apply to TT ?).
Actually some of the older Atari drives are rather prone to failure, some customer downtime would have been eliminated if the drive assignment had been in order (it's easier to work on a one-drive computer than a no-drive one).
Not everyone dares open the box and change wires / links to get things fixed themselves outside of normal business hours.

Does anyone know whether TT TOS suffers from this fault?

398. looking for C++

Newsgroup: comp.sys.atari.st
Date: 1991-01-15 15:04:17 UTC
From: bresson@cbnewse.att.com
Message-ID: <1991Jan15.150417.8650@cbnewse.att.com>
Source record: 235790

Sorry if this question has come up before (though I've never seen it), but
I am trying to find a C++ compiler/debugger for the ST. I don't mind if
it's PD or a commerically-available product. I currently don't have access
to anonymous FTP sites, so any PD stuff would need to be available on disk.
I have a 1040ST + mono monitor, though info for any configuration of ST will
is also appreciated. Also, I am in the UK, so "local" contacts would be
preferable (although please also post any others you might know of too).

Please reply direct to me at apearson@hvmpa.att.com (alternatively, try
ihlpb!att!hvmpa!apearson), and I will summarize any replies if enough people
are interested.

Thanx in advance!
Alan Pearson

WEL
Welcome to comp.sys.atari.st
============================

This newsgroup is devoted to discussion about 16 bit Atari micros. At
present that includes the Atari 520ST, 1040ST, Mega ST, STe, and STacy.
There are also emulators for the Apple Macintosh and IBM XT available.
Finally, there is the Lynx (a game machine) and the Atari TT and ATW.

Most of the people who read this newsgroup are technically oriented.
The newsgroup serves as a resource for Atari users ... feel free to
contribute to the discussions.

Associated newsgroups include:

comp.binaries.atari.st
comp.sys.atari.st.tech
comp.sources.atari.st

CSAST
What sort of articles would interest people reading comp.sys.atari.st?
```

==========

The most interesting articles are technical articles, impressions of software/hardware, information on Atari user-groups and shows, or helpful hints on how to make better use of the machine and its software.

The least interesting articles are in the form of 'my computer is better than...', especially when cross-posted outside of comp.sys.atari.st. If you don't know how to eliminate other newsgroups from a reply to an article which is cross-posted, ask your systems administrator.

'FOR-SALE' articles should be posted to misc.forsale, and ONLY local distribution of comp.sys.atari.st. Those outside the United States have little desire to read about that neat bit of [hard/soft]ware you're selling when you live in the U.S.A. If you don't know how to restrict distribution of a posting, ask your systems administrator.

Many articles are in the form of "How do I...?" or "Where do I...?" In this article, I will try to answer some of the most-often asked questions.

PD
Where can I get Public Domain/Shareware software?
==========

There are FTP sources and a comp.sources.atari.st/comp.binaries.atari.st mail server. You can also try the commercial on-line services such as GEnie, CompuServe, Delphi and Bix.

Using FTP, most files should be retrieved in BINARY format (at least those ending with the suffix of .ARC, .LZH, .ZOO, .PRG, .TTP, .TOS)

For anonymous FTP: atari.archive.umich.edu [141.211.164.8]

User anonymous
<enter password>
cd /atari

The atari.archive server is now available via e-mail as well. To find out more about bart (the mail server), send a message to atari@atari.archive.umich.edu with a body of "help". You will get a message back with the help file.

For anonymous FTP in the UK: uk.ac.lancs.pdsoft

User pdsoft
Password pdsoft

This is a national public domain archive, available to sites in the UK only via JANET. Mail access is available from within the UK - send mail to archive-server@lancs.pdsoft for information.

For anonymous FTP in Europe: unido.informatik.uni-dortmund.de
[129.217.64.60]

Some selected Atari ST software is in the directory pub/comp/atari-st

There is also the info-server, a mail server which (among other things) mirrors the panarthea archives. Unfortunately it is not up to date and presently contains only volumes 1-10. You can get more info about the server by sending any mail to info-server@unido.informatik.uni-dortmund.de. It will reply with usage instructions.

For anonymous FTP in Europe: cs.uni-sb.de [134.96.7.254]

Contains the most interesting tools of the german PD-scene, most of the GNU programs ported to the ST (including ports of emacs and bash and an extended version of bammis library for gcc) and also ports of software posted to comp.sources.unix, alt.sources and comp.sources.misc.

For the panarthea mail server, see Steven Grimm's monthly posting.
Panarthea holds all of the comp.sources.atari.st/comp.binaries.atari.st postings. If you aren't reading these two newsgroups, you should consider doing so.

ARCS
How do I deal with Archived files (.ZOO, .ARC, .LZH)?
==========

Files ending with suffixes .ZOO, .ARC and .LZH are archive files. They are binary files which may contain one or more other files in a compressed format. Archive files usually take up less disk space, and for this reason have become quite popular for transferring large files via modem.

In order to extract the files from an archive file, one must use an archive program. Here are the correspondences:

ARC Use ARC.TTP
LZH Use LHARC.TTP
ZOO Use ZOO.TTP

These programs are all available via FTP from the atari.archive server, in the /atari/archivers directory. Recommended files are:

arc.ttp - needed to extract the other archivers, once.
arc_602.arc - latest version of ARC, with the most fancy features
and quite a lot of documentation
lharc.arc
zoo_bin.arc

Julian Coleman recently (December 1990) uploaded an archive starter pack to the atari.archive server. His announcement reads:

" I have just uploaded an archive starter pack to Atari.Archive. It contains the following :

arc / lharc / uud / uue / zoo
U. Michigan monthly posting (05 Dec 90)

The file is 'starter.tos' and is in the form of a self-extracting lzh archive, so only needs to be downloaded (in binary mode !) and run. The archive contains sudirectories and needs about 350k when extracted."

This is probably the easiest way to get hold of the various archiving programs if you have access via FTP and can transfer the binary file to your Atari ST. The program is located in the main directory (ie. /atari/starter.tos)

There are also several GEM programs which act as 'shells' for the archive programs. The most popular are Shareware offerings, also available on atari.archive server. They are:

arcgsh35.zoo - written by Rainer Klute. e-mail will reach him at klute@irb.informatik.uni-dortmund.de or klute@unido.uucp, or klute@unido.bitnet

arcsh197.arc - written by Charles Johnson

Both are located in /atari/archivers

The GEM shells are recommended for inexperienced users (and appear to be quite handy for the experienced user as well!) They require a copy of the archive program -- in other words you need BOTH the GEM shell *AND* the archive program in order to use the GEM shell.

Documentation on the use of the archive programs should accompany the archive files mentioned above. To use ARC.TTP in order to extract these files, use thecommand line:

xh xxxx.ARC *.*

where 'xxxx' is replaced by 'arc_602', 'zoo_bin', etc. For example

xh arc_602.arc *.*

will place all files within the arc_602.arc into the current directory. It assumes you've clicked on the ARC.TTP program from the Desktop and have the parameter dialogue box on your screen.

In many cases, simply typing a '?' or 'h' will provide an extensive list of available options.

Source and binary code for archive programs have also been posted to comp.sources.atari.st and comp.binaries.atari.st. They are available via e-mail through the panarthea archive server. See Steven Grimm's posting for more information on how to obtain files from panarthea.

ERR
What does TOS ERROR nn mean?
What do the bombs on my screen mean?
==========

The information below was written, in part, by Darryl May, and posted on GEnie in January (of ????) by John Townsend. The original also appeared in the June 1988 issue of _Current Notes_ (122 N. Johnson Rd., Sterling, VA 22170). It has since found its way to me, and is being posted to comp.sys.atari.st as a service to readers.

Alan Pratt wrote to tell me that the basic information may be correct, but that it cannot be dubbed "official" unless it originates, on paper, from

Atari. This makes sense, as electronic communications are easily
modified, even accidentally.

Roland Waldi provided information regarding the difference between TOS and
GEM return codes which appears to be correct. The tables have been modified
to reflect his information.

The following is an unofficial list of the errors that can appear
while you are operating your ST computer.

```
Error description return code alert box #
=================================================
OK (no error)...................0
Fundamental error...............-1
Drive not ready.................-2

PAINT
What is the format for [x] paint program data?
==========

There is a periodic posting of ST Picture Formats, edited by David Baggett.
The file is on the atari.archive server under /atari/graphics/picfmts.doc.

GDOS
What is GDOS, and where can I get it?
==========

GDOS stands for Graphic Device Output System (at least that's what my copy of
STart, volume 1 number 1 said...)

You can get a copy of "Everything You Ever Wanted to Know About GDOS (and
more)" by Douglas N. Wheeler from the atari.archive server. The file is
/atari/programming/gdos.arc.

There is a German version of GDOS available from the atari.archive server.
The file is /atari/utilities/amcgdos.arc.

Currently, there are no truly public domain sources for the GDOS system files
or font files (at least those supplied by Atari). You can get these files
with many commercial programs, such as Degas Elite, WordUp!, etc. You might
also want to check your local user group to see if they received a copy of the
WordFlair demo program (also available on GEnie). The demo program appears to
have the GDOS system and font files.

TEX
Is TeX/LaTeX available on the Atari ST?
=====================================

The TeX/LaTeX typesetting programs are available on the Atari ST. Check the
atari.archive server under /atari/tex. Fonts and device drivers
(including one for the Epson 9-pin printers) are available on the
atari.archive server.

The latest version of TeX (3.0) has recently been made available on the
atari.archive server. The files may be distinguished from the other TeX/LaTeX
files in the /atari/tex directory by their date (posted in December 1990) and
by the fact that they are all archived using LHArc (.LZH suffix).

LANG
Public Domain/Shareware languages...
====================================

Check the atari.archive server under /atari/languages. Currently included:

abc recently posted to comp.binaries.atari.st
apl demo version
forth Don't know which one. I recommend Bradley FORTH
icon
modula-2 From Germany
Sozobon C Most excellant
Elan
xlisp
xprolog
xscheme

GNUC
Is GNU C available on the Atari ST?
==================================

You can also get the GNU C program, which runs on 1 megabyte Atari ST systems.
For more than minor programming, you may need to upgrade to 2 or more
megabytes, as the GNU programs generally assume you've got plenty memory.

GNU C for TOS is available via anonymous FTP on atari.archive. It is also
available via anonymous FTP on cs.uni-sb.de [134.96.7.254]

DEV
How do I become a developer for the Atari ST?
===

Contact Gail Johnson, Atari Rep Person, (408)745-2568

Gail can explain the program to you, and send an information packet if you so desire. Basically, for a $250 registration fee, you gain a 10 pound box filled with over 1500 pages of documentation, software -- including a compiler (Alcyon C) and a demonstration builder, a newsletter, and technical support. There is currently no differentiation between commercial and non-commercial developers, although it would appear that Atari is considering changing that some time in the future.

[Note: there is an Independent Atari Developers Association, which -does- require you be a commercial developer to join, but it is -independent- of Atari...]

ZNET
Where can I get copies of ZNET?
==========

ZNET on-line magazine is available on CompuServe and GEnie. You can also get copies mailed to you by sending an e-mail message to

stzmagazine-request@virginia.edu

indicating you wish to subscribe.

They won't get to you on Friday (which is when they're posted), but Greg Lindahl provides an excellent service to the networking community by sending these out.

ZNET and some information from the Current Notes user magazine are also available from the atari.archive server under /atari/magazines.

PALS
ST Pen Pals list
==========

Simon Chappell is compiling a list of people interested in exchanging paper-based mail "of interested parties who could then keep in touch and prevent themselves losing touch with the ST community at large (this would be especially easy if someone who still had net access could summarise current topics or forward news and advice!)"

He is accepting entries in this format:

eg Simon Chappell.

TIPS
TIPS AND HINTS from other users
==========

Any 'multisync' monitor which handles 70 video fields a second can be used with the ST; the custom cable involves no tricks, or commercial ones are available. The original NEC multisync does NOT handle 70 fields a sec.

More than 3 bombs often means more than 1 error, so interpretations are tricky.

An ST-formatted disk which is not readable by a PC can be made readable by putting the 3 bytes EB 34 90 (those were 3 bytes of hex) at the beginning of the boot sector (sector 1 of track 0, I believe). This can be done with either an ST or PC absolute sector editor.

Some (older) PC-3.5"-drives cannot deal with the short track-header produced by ST formatters. On those drives, ST-formatted disks are not readable, independent of their boot sector contents. The other way, however, does always work: format on the PC.

When using disks formatted on a PC in an ST, make sure to insert and access a disk with a different serial number in between disk changes.

For those with the 'inaccessible' mouse and joystick ports, a joystick extender cable will make life easier. The Y-cable joystick extenders make it extremely easy to keep mouse and joystick connected to port 0, and a joystick extender cable in port 1 makes for easy hookup after you've moved the machine.

If you want to try something neat with fireballs, wait until your characters are almost dead. Then cast a fireball and have your characters step forward into the path of the fireball, or have your characters face a wall and throw a fireball at the wall. This is one hell of a way to kill all of the characters.

Regent is apparently out of business, so you may be able to get a good price on RegentBase. I did.

It is too bad too because it is well done. The forms handler and procedural language interface reminds me alot of Ingres.

Warning: If you use NEODESK 3 then when you exit Regent Base, NEO bombs.

In his posting Eric Bunn says to bring the Rock Monsters to a door that uses a button to open it and then start 'banging the button' (HIS words!). All this will do is make the door move up and down! What SHOULD be done is take the Monster to the ALREADY OPEN door and then hit the button ONCE! This will make the door fall until it is completely closed thus slamming into the Monster until it (the door) is allowed to close. As the door is slamming into the Monster it is advisable to start fighting the monster as you normally would. Use your weapons but DON'T MOVE BACK until the monster is dead. If you DO the Monster will move forward out of harm's way.
Hope this is helpful. CIAO!

Or if you have the firestaff and have gone back up to have some fun, you
can
use the FUSE option of the firestaff on the non-material creatures. It acts
as a very powerful non-material spell. The only drawback is that it only
works on creatures that are right in front of you. But it only takes a
couple of zaps on the elementals to kill them and one zap on a ghost.

408. Their Finest Hour (Game)

Newsgroup: comp.sys.atari.st
Date: 1991-01-15 19:09:41 UTC
From: mg20+@andrew.cmu.edu
Message-ID: <UbYpBpC00VIAJCgVRi@andrew.cmu.edu>
Source record: 235794

Hey fellow Atarians, I'm back from break.

I got "Their Finest Hour", the Lucasfilm simulation of the Battle of Britain, while on break. After reading umpteen very favorable reviews of it, I could barely wait to get back to my computer here in Pittsburgh (it's a little big to lug home, especially with the monitor) to play it. It *DID* cost me $39 plus tax, but it's worth it. The level of detail is amazing-- graphics are awesome, gameplay is fluid and "realistic", and you can fly any one of eight planes on either side!

Enough advertising. I have a few questions about it; maybe someone out there can answer them so I don't have to write Lucasfilm Games Co.

1. The reference card included says that "certain sound and graphic enhancements appear only if your ST has 1MB or more." I have a 1MB 1040ST, but am wondering if *MORE* enhancements would appear if I had better than 1MB. For instance, although the graphics are *REALLY* good (especially considering that sometimes better than 20 points of view are being computed), the sound is, well, just OK. I don't think it's digitized. After playing Falcon, I got used to digitized sound. The machine guns in Their Finest Hour just go "snick snick snick", not "ratattatta tatta tatta" (you get the idea) like they do in Falcon. If I had more RAM, would I have better sound? (I can't test this myself, no one around here has an ST.)

2. Does anyone detect a "quick IBM port" feel to the game (i.e. the sound, and some of the graphics?) I hear they develop most everything on IBMs now (grr!!!), so this happens a lot.

3. Is there any way to approach a German medium bomber without getting your butt shot off?

Thanks,

Message-ID: <1991Jan15.193955.10308@ecst.csuchico.edu>
Source record: 235796

emerson@gandalf.Berkeley.EDU (Emerson Mei) writes:

- PPS Another nice thing is that STeno used as a DA has a gem menu bar
- INSIDE its window. (and it always tries to show the full selections
- by not only dropping down but droppIng up (can I say that?) as well.

As it is now, STeno has the drop-down (or drop-up, which IS pretty clever, when there isn't enough room for the menus to drop down) menus inside the desk accessory window; STalker has a pop-up menu when you press the left mouse button. However, Eric tells me that in version 3.0, STalker will have the drop-menu inside the desk acc. window just as STeno has now.

- Yet another feature is that they can both be run as DAs or prgs off
- the desktop. Actually there are yet still more other features
- unmentioned AND STalker 3.x w/script language and other things will
- be out soon.

Another addition STalker 3.0 will have, according to Eric, is an enhanced transfer section. Instead of just displaying the transfer status in the window's information line, a separate, smaller window will be created which will show the estimated transfer time, time remaining, size of the file, etc., etc., like Z-term on the Mac.

I seem to recall reports on Moria having a problem with machines that were freshly booted and had not set the time and date. Something to do with using timestamps in randomizing things leading to some blow-up. Try setting the time and date and see if that fixes the problem.

- Hello to all from a Neophyte Usenetter!! It's great to be
- able to communicate and exchange info with other st-users. I want
- to be on the record as saying that the ST is the best computer
- around (for its price of course).

I agree.

- Now to my question: Does anyone know of a good text editor
- that can be used as a desktop accessory? I have TOS 1.2 on a
- 520stfm w/ 1meg of ram. It does not have to be loaded with options
- - I will be using it to edit configuration files primarily. I
- have tried spirit-ed by it seems to lock-up frequently.

I must recommend STeno, but if you don't want to spend the $30 list
for STeno and STalker, there's also a pretty good PD text editor
called Notepad. I'm not sure if it's at atari.archive though. I
think there's also something called Diary which I've heard is pretty
good.

You most likely have TurboST or QuickST loaded. They sit in the BIOS trap chain and prevent STalker from being able to redirect the console output to the serial port (i.e., they grab the characters before STalker even sees them and stick them on the ST screen). I believe this is mentioned in one of the CHANGES.20x files on the disk by the way :-)

Eric

From: schram@tramp.Colorado.EDU
Message-ID: <1991Jan15.213228.14918@csn.org>
Source record: 235604

I've got a 520 STfm that don't want to mess with fixing. Either I will sell it or buy someone else's broken ST to trade parts and get one working. I don't know where to start with prices, but I'll start at $100. Whoa before you say this is too much, but I've got a meg of RAM and a good 720K drive (it's new). I will be willing to part this stuff out, no prob.

Also, I've got a color (can't remember the #) monitor to sell as well. I have no idea what the price on these has dropped to, but I'll start at $200.

Either respond in mail or my phone# is 303-467-2124. Ask for Steve.

Thanks, Steve Schram

419. Spectre 128 Manual

Newsgroup: comp.sys.atari.st
Date: 1991-01-15 21:52:54 UTC
From: bill@mwca.UUCP
Message-ID: <1785@mwca.UUCP>
Source record: 235605

I'm about to pickup a used Spectre 128 w/128K ROMs, but no manual. My intent is to eventually get a GCR, but until then I'd like to fiddle a bit. Does anyone have a spare manual, or perhaps could send a photocopy (this should be legal since I'll have an actual Spectre), or if in the (south) Bay Area I could pick up something?

Specifically, I assume that instructions on making a hard disk partition will be helpful - if these can be emailed I'd be equally grateful.

Thanks!

It's the method of choice! Personally, I found it more fun to put up a
set of 4 fireshields and do it - even a 400-point blast hardly does a
thing to you. This technique also can be used to prove conclusively
that lightning isn't nearly as good as a fireball, mana point for mana
point (at least at close range ;-)

I have a project that I want to do on my STe using the "new" 15-pin
controller ports on the side.

One problem.....I have NO idea how to address these ports. The documentation
that came with it only gave the pin-out info, no addressing info or ANY
other info. Speed, read/write ability, etc . ....

All I have is the pin-out and an idea.....help!!!

>
>Note the " in the second form to avoid the ; being taken as a command
>separator.

Actually, it doesn't matter _what_ shell you are using, you should use
the form with the forward slashes and colon as separator. That is because
it is not the shell, but TeX which will interpret the contents of the
variable, and the new TeX binaries want the paths in UNIXMODE format,
and with colons as separators. Therefore

setenv TEXINPUTS ".:/dev/D/tex"

would be correct under any shell (which uses setenv).

Hope this isn't too confusing...

424. questions about GFA basic and REPLAY 4

Newsgroup: comp.sys.atari.st
Date: 1991-01-16 03:21:38 UTC
From: tmwhitehead@miavx1.acs.muohio.edu
Message-ID: <3374.27938072@miavx1.acs.muohio.edu>
Source record: 235611

I have REPLAY 4 (awesome sound digitizer)
I also have GFA Basic 3.(something)
I have a 1040 ST with a color monitor.

My question is this:
REPLAY 4 comes with sample GFA source to play digitized sounds, however, this is slow. it even causes the mouse to stop...I'm trying to write a game and I need something faster than what I'm using. The source I'm using loads a program called bascode.exe. Does anybody have or know where I could get a more efficient module I could call from GFA basic to play digitized sounds?

My second question is this:
The game I'm writing is, essentially, one large loop. Currently, I have a variable that I increment each time through the loop and use as a counter to determine the timing of certain events. however, since the program falls through different segments of code depending on the players actions and the timer value, the speed changes. I've been able to control it somewhat by putting in small pauses in the right places, but if I could get access to an internal timer, I could use that to time my rpogram. I need pretty small increments (probably at LEAST 1/100 of a second...)

THANKS for any help/suggestions....

Todd Whitehead

Atari At COMDEX makes BIG impression

Last week at Comdex Atari "Upstaged"(quote from monday's USA Today) Sega's announcement of it's Game Gear by drop the price of their LYNX game system from $180 to $100. Also when a person now purchases a new LYNX they will receive a free game from Atari with a copy of the purchase receipt. Atari also showed behing closed doors the new PANTHER 68000 based video game system. According to the few which were allowed to veiw the Panther, they could not keep their mouths closed. With the Panther was shown the LYNX adapter for it to allow LYNX games to be played on the TV. The panther will jump onto the scene this summer against the nintendo SFX 16 bit machine. THe panther will be priced "under $200" as apposed to the SFX $250 list price...

Source record: 235618

Ralph Sobek asks:
>Wouldn't it be possible to FORMAT a floppy and initialize it with a
>bigger ROOT directory?

Indeed yes... after a disk is formatted with an XBIOS(10) call, the boot record can be written with "custom" information, including number of sides, number of tracks, number of sectors per track, size of FAT, and also the maximum number of files in the root directory.

This last is normally 112, but can be any number, with a minimum of 16 files, and in multiples of 4.

Essentially you could format a disk that was all directory, with no room left for files... if you wanted to..

BobR

430. Q: Rodney's UUCP Modules

Newsgroup: comp.sys.atari.st
Date: 1991-01-16 05:10:11 UTC
From: roberson@aurs01.uucp
Message-ID: <59444@aurs01.UUCP>
Source record: 235620

I have a few problems with Rodney's UUCP Modules (RUM, aka Mercury UUCP).

1) The config file (/etc/config.sys) doesn't allow your uucp site name to be different from the hostname in your domain. For example, my uucp site name is arenic, but my domain name is nic.aren.org. Line 0002 wants my site name and line 0004 wants my domain. It's a no win situation for me. Any suggestions?

2) The host I call has a delay before the login comes up so I really need to be able to do "\d\d\r\d\r ogin:" in my send-expect script. However, it doesn't look like Rodney's modules do send expect. Is this correct or is there a way to do it?

3) While running poll.g (as per the short English docs) I get error messages about not being able to alloc 1024000 (approx) bytes of memory. It then tells me to try fold100.prg to fix the problem. Are these modules designed to be run in a 1meg system?

4) My feed wants to be able to call me. Is there a way to make RUM go into a mode where it waits for incoming calls until I kill it?

5) Once I invoke login, it seems that I have to reboot to get out. Is this true? Is there some graceful and protected way to tell login to return me to it's outer context?

6) Has a version of UUCP been ported over for MiNT?

thanks,
-chip

431. Re: Small's Email Address?

Newsgroup: comp.sys.atari.st
Date: 1991-01-16 05:29:17 UTC
From: dsmall@well.sf.ca.us
Message-ID: <22658@well.sf.ca.us>
Source record: 235621

The preceding message asked for my netmail address.

I *used* to have a net access to my office through
boulder.EDU!tcr!gadgets!dsmall.
This died an unhappy death when the host system gave its power supply to
save another AT&T 7300's life (just *try* and find a power supply for them).
Since then, email to that address has gone to the great bit bucket in the
sky; I have to periodically shovel the bits around the telephone line
off the floor... dust buster doesn't seem to work.

I do hang out here on The Well on a less-often basis (as it's not for-free,
see) and *try* to answer mail. I've been poor at it recently as 110% of my
time
has been allocated to getting Spectre 3.0 out the door -- FINALLY done --
as well as the 68030 board. I apologize to people I've not answered.

I will point out that I'm a NetMoron, and OFTEN I'll write up a nice
50-line reply to someone's question -- and have it "bounce" back to me.
I'm sure there's some easy, swell way to figure out why, but I sure haven't
found out. It's frustrating. Worse are the letters saying, "Why don't you
reply?" That's mondo frustrating.

Anywho, for the time being, use dsmall@well.sf.ca.us, or whatever
path (see above) this message arrived to you through.

Sorry for the troubles with the Net link. It's supposed to be back up
on a new UNIX box in my office, and it UUCP's okay, and nothing happens...
fizzle.

From: dsmall@well.sf.ca.us
Message-ID: <22659@well.sf.ca.us>
Source record: 235622

(The referenced article asks if Mac SE ROMs work in the Spectre.)

Alas, no, they don't. The only ROMs that work in Spectre are 128K
ROMS, also called "Mac Plus" or "Mac 512Ke" ROMs. No other ROMs work.
^?The cartridge hardware cannot even work with 256K ROMs plugged into it.

Spectre no longer supports 64K ROMs. In truth, many versions were
released that had 64K support broken, and I think we had about one complaint
every 6 months from someone who found this out -- the whole point of the
product
was the 128K ROMs, as everyone knows. I don't even know which version was 64K
fixed;
I do know that there were so many differences that supporting twin sets
of ROMs drove us up a wall and added a lot of (bug-possible) code.
Also, working with hard disks on 64's is most entertaining if you're
into the bondage scene.

I don't have any plans to do a 256K ROM emulator, either for the
Mac SE 256K ROMs or for the Mac II 256K ROMs (they are VERY different ROMs,
just same total size). I think I've disassembled enough for three people in
my life.

(The preceding article is a discussion of use of EPROMS in Spectre 128/GCR).
(Howards says basically that they work.)

Howard, I know you mean well and are trying to set the record straight, but we pulled some very subtle stuff in Spectre to put a "Keep Out" sign on EPROMs in the unit. If nothing else, I wanted something to show UnNamed Corp. that I was trying my best to prevent piracy. And the code itself was dual-encrypted to help prevent "cracked" copies from using disk-based code.

The problem is, you're not going to believe me unless I tell you what I did, and if I tell you, the world will know how to break the protection that is most certainly there. I get a few tech notes each month with a specific crash/behavior that tell me, for just about certain, that the user has plugged EPROMs into the Spectre.

How's about this. I'm willing to fund a dinner for two here in Denver. I'll tell you how we did what we did, and why it works, over dinner. If it sounds cool to you, say so on the Net; if not, say so, too. But I think you'll see that the stuff is subtle enough to cause it to be very effective in the hands of the average pirate.

I don't know which AT&T facility you're at; there's a big one in Denver that Dan Moore was at.

Sound fair?

In the meantime, I would appreciate it if you'd stop saying flatly that EPROMs work in Spectre. They don't an amazing amount of time, and the results are pretty interesting.

(The preceding notes are on the discussion of Mac 128 ROMs, Apple, etc.)

Roy, though many people have said so, Apple has never "cut a deal" with Gadgets.

Apple did send one letter to my old outfit saying not to call the unit Mac Cartridge, as they owned rights to the word "Mac", not to sell ROMS, and something I cannot recall that was minor. We agreed and told them so. Back then and now, we have never sold ROMs nor called it Mac anything.

My guess would be that it isn't worth Apple's time to stop something that probably has a net not-very-much effect on their sales. Heck, I've sold many a Mac system to users who couldn't wait for 300 dpi lasering and stuff. Is it such a terrible thing for Atari users to be exposed to the Mac OS? Seems like the greatest ad in the world and it's worked many times.

Many people buy Spectre GCR these days to be sure they'll get something out of the ST hardware investment -- "doorstop insurance", as well.

Yes, the Spectre cartridge can detect EPROMs plugged into it, but I wish to keep quiet about how, since it might allow the technically inclined to bypass it. Some people have said "foo" to this and said EPROMS work, but I *do* wonder about their crash rate.

I just wanted to set the record straight re: agreements with Apple.

436. Re: how about an upgrade to 68010

Newsgroup: comp.sys.atari.st
Date: 1991-01-16 06:08:59 UTC
From: dsmall@well.sf.ca.us
Message-ID: <22662@well.sf.ca.us>
Source record: 235626

I've plugged a 68010 into an ST and gotten it working (with the help of a Zax in-circuit emulator).

TOS 1.0, 1.2, and 1.4 do not recognize the larger stack frame associated with the 68010,20,30,and 40. They also adopt space-saving techniques
that make them 680x0 incompatible, such as stacking up an SR and a PC, then doing an RTE-- which will probably bomb on a 68010.

To bring up the 68010, we used a jumperboard with TOS 1.6 ROMS in it, mapped at ^?$e0 0000 for 256K worth. The 68010 then worked nicely. (We did have
to remove some ST-E specific stuff from the ROMs; it was trying to initialize hardware we did not have in that ST!)

From there, we went to the 68030.

It's quite a project to get the 68010 up on the ST, and that chip is pretty much obsolete anyway. The 030 is where the action is at.

I've got an original Atari 1040 ST for sale (just the cpu).

- Original Tos in ROM
- Built-in RF modulator for use with color TV
- Computer/TV switchbox and cable so it's ready to hook
up to the TV and use.
- Internal DS/DD 3.5-in disk drive.
- Mouse
- ST Basic

$400 or best offer. We'll discuss the shipping.

I also have Battletech - The crecent hawks inception - $15.

NONE, but they do not just up plug, you must swing them out to say 30
dec, then just pull them out, or just lift them, no force is needed
also they have 2 small clickers on each side of the Ram boards, just
unclick them . and swing the board down, it will then lift out...

What SIMM's did you bye, I tried to reply your E-Mail, but the System
here in NZ. did a hick up. the ones that J.R. Allen recomends are 9 bit
70 ns ones, as they can be used later for a PC. the Atari does not use 9
bits but then they can be cheaper then 8 bit ones, the first STE to be
shiped to NZ. had 9 bit SIMM's fitted...NOTE: there is no real need for
anything faster than 150ns and 8 bit, but don't forget will you still be
with this STE at the end of the year ????....

443. For_Sale: Atari 1040 ST with MIDI sequencer, C development etc

Newsgroup: comp.sys.atari.st
Date: 1991-01-16 07:53:18 UTC
From: a9@public.BTR.COM
Message-ID: <1361@public.BTR.COM>
Source record: 235634
Cross-posted to: rec.music.synth,ba.market.computers,misc.forsale.computers,comp.sys.atari.st

```
For sale: Atari ST 1040, 1 Meg RAM.
Monochrome Monitor, 720K floppy (built-in), mouse
20M HARDDISK. (MIDI ports, serial, printer, game ports etc)

Dr. T KCS Level II ver 3.0 (MIDI sequencer) $200+ value (i think)
Quick Score Music Notation program for KCS $99 price
Laser C (list price $199) with complete GEM library
and UNIX library
Lots of other software (communication, desk etc)
Also Public domain GNU C, UNIX like shells,
UNIX utilities (ls, mv, cd, uudecode, grep, tail etc).
(GNU C and libraries are on disks, not fully loaded yet).

Great system for Music sequencing, or serious C development (or both!)
Asking $795 for everything (including 60 disks (Sony, TDK, Verbatim))

-anony a9@btr.com

[Explanation of moria v 4.87(?) problems removed]

Any suggestions or similar problems out there???

I haven't that problem with my moria 4.87 you (ans someone else have had). BUT
I know what to do (Thanks to Mr. Wilson who had made the port to ST):

You have to set the time in your ST before you start playing!!! moria
uses ST clock to seed the random number generator and with some values the
generator (not sure) will blow up... I think it depends on minutes, but I'm
not sure.

Hope this helps,

445. Mini Desktop

Newsgroup: comp.sys.atari.st
Date: 1991-01-16 08:16:54 UTC
From: felner@iiic.ethz.ch
Message-ID: <21590@neptune.inf.ethz.ch>
Source record: 235636

Yesterday a strange thing happened to me. When I booted my 520ST, only a quarter of the whole screen was used. I got a mini desktop in the top left quarter of the screen with the samll font being used for the menus and other text, but the standard size desktop icons. Everything seemed to be working fine, I could open and move windows, the TOS copyright box centered correctly within that small portion of the screen. Scrollbars and close boxes were drawn correctly, but they were thinner/smaller due to the smaller font being used. When I rebooted, everything was back to normal.

Now I wonder what is necessary in order to make the desktop come up using that small font but the whole screen. Is this possible at all? Has anyone seen something similar?

There is a program to play back four channels of sound while taking a maximum of 33% of the processor time. It's written by the CareBears. It is almost certain that it can use replay 4 samples. It's called TCBSOUND; Retails at $99. In stock at the Atari dealers in this area!

However, I don't no if it can be called from GFA Basic.

Source record: 235647

I recently upgraded my mega2 to 4 meg, and found, for some reason,
cachexxx.prg refused to install on bootup anymore. It would install
fine from the desktop, but not autoboot. By tracing through its auto
boot cycle with amonST, I found it started it's search for itself
with Fsnext, then put c:\auto in and fsnext'ed again. By changing
the first Fsnext to 4d Fsfirst, it started to autoboot again.
Could someone from Atari tell me why?

From: alanh@logitek.co.uk
Message-ID: <alanh.664023971@krypton>
Source record: 235649

Hello Internet,

Has anyone bought AT Speed ?

Has anyone got true protected Mode programs to work ?

What I have is AT Speed V2.21 and V2.24. I know Windows 3 works in
Standard Mode, but this is the only program I have found to do this.

I have a 4 Megabyte Machine, 48 Meg Hard disk and I am trying to run
a few DOS programs that switch the processor into protected mode, also I am
trying to boot from an OS/2 install disk which hangs the system after loading
the file OS2KRNL and finally XENIX which hangs when determining the System
components, i.e. memory size , ports available etc.

Anybody know Hans-Sack email address ?

Or has anybody else experienced this and know a fix ?

Any comments at all much appreciated.

Either post to news or email me at : alanh@logitek.co.uk

....

I've never argued the existance of a problem, only that I've been unable to re-create it. That makes it nearly impossible to locate the problem, let alone do anything about it.

I've a theory that the problem is centered around a huge file list, a problem in the combination of MWC malloc, GEMDOS Malloc, and the Pexec of the Ramdisk, resulting in an overwrite of something somewhere in memory. Until I can recreate the problem, however, I can't do anything about it. And, if I can recreate it, and it turns out to be one of exceeding the memory available, then the only fix possible will be to deal with smaller quantities of files, or expand your memory.

>
>Yep! Me too...but with Turtle. Turtle can't handle my d:\tex\fonts
>directory.

BackupST is a *very* clean program. Except for reading/writing to floppy/screen
I use high level gemdos calls to do the job. This means that if GEMDOS has
the problem, BackupST will have the trouble too. I am not sure if the problems
described above, are GEMDOS errors, but because Turtle and zoo have the
same problems, I think that it is indead a GEMDOS error. Is there anybody
on the net who can confirm the existence of such error. Is it fixed in
newer versions of the TOS (1.4 or 3.0)?

As far as I know right now, there is one bug clear bug in the program:
The program assumes that it needs 32K of memory for the screen
which can be reached by pressing the 'esc' key. This is not true
for 'TT' machines, and for Mega ST machines with larger screens.

I am currently working on a new version of the software which will be
completely under GEM. This new version will fix the memory allocation
error.

BackupST will become slow if directorys with hundreds of files are backup'ed.
BackupST is slow because Fsfirst() and Fsnext() are slow. Is there anybode
who knows how to make this faster in a *portable* way?

If you have wishes for the new version of BackupST please mail them to
me.

Fred

...which is, I can't seem to copy files from my UNIX account here
at school to my computer at home. Admittedly, I'm not very good at this

Some helpful information: my account is on a UNIX-based system
(a SUN, to be precise), but I also have access to a VAX account, so
I could ftp to the VAX if transfer is easier there. The VAX account
has its own phone number, but the SUN requires an extension. Yes, I
have logged on from home, so I'm not completely hopeless (just marginally
incompetent).

What I usually do is read and write MSDOS Disks on the UNIX System.
Your sun could be able to do so directly.

If you have a Network which is connected to PCs you can try to ftp to
the PC or even mount your UNIX filesystem via NFS. (This all of course
depends on the PC having the right software).

Anyway, I always found it easier to find a way to transmit files from and
to a MSDOS PC. Since your ST can read and write the PC's disks this is
quite convenient.

If you absolutely want to transfer it via phone the easiest way might be
to use kermit (which should be available on the sun as well as on the
vax).

>
>I've noticed this as well, I have a 1040 STf and TOS 1.0 :-(

One mention I email, 2 I post. I made a mistake with the random number generator in umoria 4.87. If it gets a seed of 0 in one of its 3 sections, it goes into a tight loop. If the date/time (which is used as a seed) is left at the default startup value, that happens. The solution is to set the date/time before starting the game. Unfortunately, when the game was first distributed over usenet, I mentioned in the cover note to the posting that it was important to set the date/time (I didn't then know HOW important), but didn't put it INSIDE the distribution package.

In any event, new versions of umoria are ready. I think (hubris) it's reasonable to wait about 2 weeks for the one I compiled, which gets support from me, and which seems clean, even when I look for bugs.

I dunno. It looks great to me... so what if it's a port! I just hope they continue supporting the ST. I really hope they port the new "Secret Weapons of the Luftwaffe" game.

>3. Is there any way to approach a German medium bomber without getting
>your butt shot off?

Very carefully. The best thing to do is fly the bombers yourself. This way you'll get a feel where their blind spots are. Then attack them from these angles. My favorite technique is to come in head on about 1500 feet below them, wait for them to get directly overhead and then pull straight up and roll 180 degrees. This gives you a great shot at the underbelly for a long time ('cause your airspeed drops as you climb). Don't try this with an ME-109 on yer butt tho...

Cheerio!

Message-ID: <4678@mcrware.UUCP>
Source record: 235711
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Just a quick note to let folks know about the IC AdSpeed ST 16MHz accelerator.

I bought one from MicrOtyme for $229. Had it installed by ICD for $40. I love it! I have been spending most of my time in PageStream lately. It really speeds it up. Is seems to be compatible with all my software. The only thing it causes trouble with is my QMI Deskcart (maybe it does'nt like to be read so fast?). It speed up Flight Simulator II without any adverse effects.

The general speed up is around 66%, but can be much faster if the code contains loops that stay in the 32K on-chip cache.

If you're considering an an accelerator, go for it!

From: flagg@wpi.WPI.EDU
Message-ID: <1991Jan16.174644.1049@wpi.WPI.EDU>
Source record: 235712

For sale:

Atari 520ST with 1 MEG
40 Meg hard disk (ST251-N)
Double sided drive (in hard disk case, no extra power supply needed)
Color Monitor
Panasonic KXP 1080i printer & cable
2400 Baud Modem and cable
Sound Digitizer
IMG scanner mounted in a Ribbon case for the printer
Joysticks etc.
Midi Keyboard by Casio and Midi Cables

Lazer C compiler
Personal Pascal Compiler
Timeworks DTP
Circuit Maker II
Timeworks Spreadsheet
Multiple games
All archives on hard drive

Atari ST Internals book
Atari ST logo book

Any other goodies I have around for it...

All manuals, almost all origial boxes.

I will only sell as a unit: $1500 (Yes it all works)

This ST was hardly used and was very well taken care of, everything
works great. The plastic over the ST logo is still in place...
Almost all original packaging is still in existance for all of
the above.

There is one catch: I'll demo it for anyone in Worcester, MA
(or let anyone play with it to test it all out), but once you
buy it, its yours. I can't afford to be responsible for "accidents"
while in transit or installation, but I'd be glad to answer
any questions about it from the new owner...

Interested? Call (508) 752-8503 and ask for Gordon, or post E-mail

>Is it possible (does anybody have a driver) to print notator songs in
>Postscript? to disk?
>-steve
><selick@bucsf.bu.edu>

I have been wanting to do this for years now.. as a matter of
fact, because NOTATOR does NOT produce a stand alone file of
any format other than its own (to be used only by the program
itself), I have been forced to look into a mac system in order
to publish my book. C-LAB is out of Germany. Poscript lives
in the US.. the best we can hope for is that C-LAB gets enough
people vocalizing this DTP need.. I have heard that there is a
that C-LAB might consider the ability to create a .IMG file..
or perhaps a .CVG (Calamus Vector Graphics) file format..which
I also hear is trying to become a standard in Europe...

I strongly suggest calling Mikhail Graham, the US rep for
C-LAB argue the absolute necessity for this.. and that we
need it NOW.. not next year!

his # : (916) 265-6484

Also, suggest that SOFTLINK become available to all ST'er's
and that it should be pushed to LEVEL III, a more powerful
multitasking program.

458. HELP! My 1040's drive DIED and I need advice FAST!

Newsgroup: comp.sys.atari.st
Date: 1991-01-16 18:12:34 UTC
From: kuento@kuhub.cc.ukans.edu
Message-ID: <27938.27944332@kuhub.cc.ukans.edu>
Source record: 235714

HELLLLP! here's the situation: I bought a used 1040ST, and when it arrived, it was soon on the fritz. It looked like head alignment problems (thanx to those netters who helped then) - I brought it to a local repair shop, but later found out the guy had never worked on an Atari. It took him 2 MONTHS to finally say to me "It's a bad floppy drive. You need a new one." He's asking 90 bucks for a new floppy drive, says it'll be 80 dollars in labor to install it AND I DON'T WANT TO GIVE THIS GUY A *DIME* IF I DON'T *HAVE* TO! Basically, I feel that (a) he could be wrong (b) he could be lying (c) he could be covering up some damage that *he* inflicted trying to figure things out (d) he's been jerking my chain for two months, and wasn't honest about knowing how to fix an Atari when I brought it to him (e) He also says he'll have to "carve" the casing around the drive port so he can fit the new drive in, and I don't much like the sound of that.
Incidentally, the drive he wants to sell me is a Chinon F354...is this worth 170 bucks to have him put this in? I *seriously* wonder...
So, (A) IF I BUY AN EXTERNAL DRIVE, CAN THE MACHINE BE RESET SO IT BOOTS OFF THE B DRIVE?? This would be a good quick fix, until I can find someone else to install a new internal drive, or install one myself. If this IS possible, where can I get a good external drive? I have no access to mail-order stuff: I am a "new" Atari owner, and not at all familiar with hardware support and distributors, or prices, or such. That's why I'm turning to the Net for help!
(B) HOW EASY IS IT FOR ME TO BUY MY OWN INTERNAL DRIVE AND INSTALL IT MYSELF? At least one person suggested, way back when, that I might just want to buy a drive and install it myself - how easy is this to do? Does it require special tools, etc? How do I obtain such a drive? What kind of prices/models should I shoot for? Oh, yes - and HOW does one go about fitting a new drive into the Atari's casing if it isn't the exact same dimensions? ARE there drives that just pop in like they were made for the ST? Again, HELP!
I need to know what my options are, asap, so I can go in there, tell the guy to just *give me my computer back!*, and be doing the right thing. I want to join the Atari family, at long last, but I want to do it on MY terms! PLEASE e-mail advice/suggestions/mail-order info, or anything that can rescue my computer from this guy's clutches! Thanks a million to you all!

459. Re: case insensitivity in TOS

Newsgroup: comp.sys.atari.st
Date: 1991-01-16 18:17:11 UTC
From: bill@mwca.UUCP
Message-ID: <1786@mwca.UUCP>
Source record: 235715

Regarding case sensitivity of GEMDOS...

At work I use both OS-9 and Unix. OS-9 is not case sensitive, although
filenames will contain both upper and lower case in directory listings
("SOURCE" == "Source" == "source"). Unix, of course, is case sensitive.
I prefer the OS-9 method (employee bias notwithstanding) because it allows
me to use capitals where organization/convention calls for (directory names
in caps, for example), but still makes it easy to specify filenames. Besides,
I don't think it would be very good procedure to have both the file
"stuff.txt" and "Stuff.txt" in the same directory. Perhaps there would be
an easy patch to TOS to not have filenames converted to uppercase when
written to the directory sector, but still have "open" calls use uppercase
when comparing filenames for matches...

Anyone else out there used Alchimie Jr.? I downloaded this from the MIDI RT on GEnie...it is a shareware (non-crippled) sequencer that appears (I'm rather new at MIDI) to be immensely powerful. Supports 256 tracks (why would anyone _possibly_ need this many, when limited to 16 MIDI channels?), quantization, elaborate grid/piano roll note display, full multi-tasking (most any function can be performed while the sequencer is playing or recording), multi-windowed user interface, MIDI file import/export, and full (though somewhat mangled English) documentation. The authors claim they've spent two and a half years developing Alchimie, and I can believe it. Nothing seems to be missing. Registration is only $25. I'll try to get it to atari.archive.

461. Tape Mechanism

Newsgroup: comp.sys.atari.st
Date: 1991-01-16 18:44:47 UTC
From: cummins@d.cs.okstate.edu
Message-ID: <1991Jan16.184447.14109@d.cs.okstate.edu>
Source record: 235717

I'm wanting to add a tape backup system to my ICD Host Adapter based
SCSI hard disk system. Does anyone know what kind (brand name/ model no.)
of SCSI tape drive ICD sells in their FaST Backup setup? I'm interested in one
but I want a reputable mechanism as it will see daily use. ICD doesn't
seem to know (or care to disclose) the mechanism they use so I'm worried that
it may be a cheapo unit....

462. CODEKEYS

Newsgroup: comp.sys.atari.st
Date: 1991-01-16 18:49:02 UTC
From: ramsiri@blake.u.washington.edu
Message-ID: <14532@milton.u.washington.edu>
Source record: 235718

I am interested in CODEKEYS, the macro generator from
Codehead SOftware. My question is this:

Condsidering that the macro
generator uses discrete timing, would the following be impossible:

Would the following macro work:

After SOFTLINK (partitioning software) boots from auto
folder, run a program in partition 1, boot partition 2,
run NEODESK and an autoboot FROM WITHIN neodesk, boot
partition 2, run another Neodesk and another autoboot
from within neodesk...?

Considering that the macero has to wait for the installation
of the partitions AND the loading of the programs before
going on the next partiton, i was wondering if the machine
would get bunged..

The reason this macro would be wonderful is that SOFTLINK
doesn't allow for preconfigured partitions at bootup...
that is, programs that will auto load in each partition
as they are installed... as a matter of fact, the
partitions are never really booted until you manually
go and press SHIFT-#pad .. seems like this could be done
with CODEKEYS. No?

If CODEKEYS can do the above, consider me a buyer today!

thanks

-kevin

|> PostScript files on the ST?

Yes - you can print them using Ultrascript, from Imagen. I have heard that it is not going to be continued as a commercial product, however. I know of no "postscript displayer", unless there is a DTP package which could be fooled into thinking your postscript file is really EPS. I'd go with the Ultrascript solution. Sorry, I don't have contact information on them, but you should be able to get a quote from an ST dealer or mail-order house.

From: rosenqui@crc.skl.dnd.ca
Message-ID: <1991Jan16.190956.13682@crc.skl.dnd.ca>
Source record: 235720

In article <1991Jan15.140123.3570@cbnewse.att.com> hofmann@cbnewse.att.com (james.r.hofmann) writes:
>I would like to know how the people using the Viking Moniterm (or >equivalent) like it. Specifically, what are the limitations (programs >that won't run, etc.). How do showdvi, gulam, mg, etc. perform with >the monitor?

I've had a Moniterm for about a year and love it. I've had a bit of trouble with the unit itself, but that's because I bought a "slightly used" one from Moniterm at a special developer's discount. The monitor itself is of first-rate quality. It may seem expensive compared to those $799 dual-page monitors you see advertised in MacWorld etc., but the picture quality is second to none (the TT 19" monochrome is also top-notch).

I don't have experience with the rest of the programs you mentioned, but gulam works quite nicely on it. My only complaint is that gulam likes to keep the cursor positioned at the bottom of the screen, even if you clear the screen, so it has to scroll the whole 150K of screen every time. Gulam even recognizes the 160x50 screen so that the output of 'ls' etc. use the full screen width.

Most true GEM programs work rather nicely, I can vouch for the ones I use regularly:

STalker/STeno
Spectre (GCR & 128) [all the Mac stuff I've tried uses the big screen]
NeoDesk 2.05 and 3.x
HotWire and all the other CodeHead stuff
WordFlair
Timeworks DTP
TrackerST mailing list s/w
LDW Power (a joy on the big screen!)
Turbo C 2.x (German)
LGSelect and UIS III file selectors
Idle 2.x PD screen saver
ARCShell
QuickST II or the TurboST Moniterm version

Many TOS programs work perfectly, or work with minor screen mess ups. It's impossible to know until you try however.

A reasonably good test to make with your favorite s/w before buying a Moniterm would be to try the programs with one of the software-based big screen emulators. If the program handles the simulated screen well you've got about a 75% chance of it working on the real thing.

Programs that do screen flipping or their own scrolling often look like they're working since the physical screen is the same size as normal, but fail with a real Moniterm.

I am trying to hunt down an address for Sigma Press in England. I have
their Phone, and I asked them to send me a catalog, but I have had no luck.
I know the name of the book that I want from them, and I even know the cost.

I need however to know where to send an order. The book, by the way, is on
the Atari Portfolio

469. SM124 monitor problem

Newsgroup: comp.sys.atari.st
Date: 1991-01-16 20:12:24 UTC
From: bright@ccu.umanitoba.ca
Message-ID: <1991Jan16.201224.10267@ccu.umanitoba.ca>
Source record: 235725
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I've got a problem with my SM124 monochrome monitor. A few months ago I started to loose the left-hand edge of the display -- i.e. characters in the first column of the display were squished into about half their normal width. The problem has gotten progressively worse, until the point where I can just barely read characters in the second column (the first column has pretty much disappeared entirely). Fortunately I use mostly GEM applications, so I can move the window to the right in order to keep things readable, but if the problem gets much worse I'm going to find myself back in the days of 40-column displays.

I'm sure the problem resides in the monitor, since connecting it to my wife's 520ST doesn't help. The monitor is about 3 years old, and has seen very heavy use. Does anyone know:
(i) what's causing the problem?
(ii) how to fix it, short of buying a new monitor?

Thanks alot for any advice, BBB

470. MIDI starter

Newsgroup: comp.sys.atari.st
Date: 1991-01-16 21:09:54 UTC
From: bdm@spacsun.rice.edu
Message-ID: <1991Jan16.210954.19744@rice.edu>
Source record: 235726

What is the best way to enter the world of MIDI? Namely, what program
should I start with, with the considerations being price, ease of use,
expandabilty? What synthesizer should I get, within the above guidelines?
I already have musicological knowledge, so I'm not scared of staves and clefs.
Don't bother to e-mail, since I'm sure there are a few more interested parties
out there. How available is the MIDI book that was earlier stated to be
out of print. I noticed that the GEM handbook was listed as such, but since
I just bought it, this may not be reflective.
Is there a lot of specific talk on other nets? I'd hate to tie this one
up on a tangential subject. Much appreciated.

471. new nroff announcement...

Newsgroup: comp.sys.atari.st
Date: 1991-01-16 21:13:21 UTC
From: rosenkra@convex.com
Message-ID: <1991Jan16.211321.25497@convex.com>
Source record: 235727

i will be releasing some enhancements to nroff v1.1p3 in the next week or so, then will start on v2.0. i know a number of people have told me they made enhancements, so i'd like to collect them before i start 2.0. please try to send diffs to v1.1p3, if possible. don't send the entire code. send to address at bottom of this mail.

what i have done recently, is to create a version (a subset) of less(1) which reads ANSI/vt100 escapes (e.g. ESC [1 m for bold) and changes fonts while it outputs the file. since i used line A to get the address of the monospaced fonts, and some of u do not like line A (TT owners, typically), i thought i'd ask for alternative which do not involve VDI, or "trivially" involve VDI. note that i am no stranger to AES/VDI, having developed a 60,000+ line application (of which 50,000 lines was AES/VDI code, and the rest the actual work).

nroff has been modified to generate these escapes (if "-A" switch on cmdline) for font changes (\fB, \fI, \fR, \fS). the manpager program lets u look at these files. i had intended for this to replace the PAGER in my man(1) program, but it can run standalone, too.

manpager basically does this:

1) get ptr to line A struct
2) find DEF_FONT ptr
3) find V_FNT_AD prt
4) replace these ptrs to point into the new font data (char offset tables remain the same - this is only for monospaced fonts - so far) at each escape seq
5) after line is printed, reset the old pointers

this is done in less than 50 lines of code, and is solid, and TOS independent (if the TOS supports line A, that is). i have 8x16 system fonts in manpager (builtin, not loadable, yet) for bold, underline, "small" (just 8x8 with added scan lines), and a special char set which adds u/l case greek, box drawing chars (single and double line), large square/curly braces, math symbols, etc.

is there a better way? don't suggest GDOS since i do not have it.

Thanks. Seems like I tried that, but I may have just been clicking
on the number...

> Yeah, it's a nice, powerful CHEAP program. I've made some pretty
> complex music with it. Have you tried editing controllers with the
> mouse? Gobs of fun...

You bet! Couldn't figure out how to get rid of it though.

I was really pleased to get this demo, and hope that more companies
do this sort of thing. It really relies on good ease of use, though,
because you can't ship too much documentation on disk with the
application.

> MPE probably isn't implemented on your demo, tho.

Wrong! It's there so that you can check out a crippled copy of
Quick Score or whatever it's called. I was impressed that MPE programs
can share data -- I just expected task switching.

Cross-posted to:
comp.sources.d,alt.sources,comp.misc,comp.sys.atari.st,comp.sys.ibm.pc.programmer,comp.sys.amiga.tech,alt.sources.d

(Sorry for the wide distribution. Followups are directed to comp.sources.d.)

There seem to be zillions of versions of the "lharc" archiver floating around, with no coherent version numbering scheme so it's next to impossible to tell which versions are more recent than others. I'd like to coordinate an effort to come up with one standard version of lharc, and keep track of patches in one place so that there'll be some order to the version numbers.

The version I'm using right now is "C-LHarc Version 1.00," from alt.sources. Someone has sent me a version 1.02, derived from 1.00, but with some patches for better operation on Amiga systems. Which other versions are out there in source form? The version I'm using seems the most stable of any I've seen, so I think it's a good starting point.

If the original authors of any of the lharc versions would prefer to keep control of the source, that's fine with me, but I'd like to know. Right now there are lots of people doing their own things with the program, and I'd like to see the mess sorted out for the sake of the users.

At some point, I have some changes to make to the software, too, but I'd rather change a unified, standard version of the program than create yet another off-the-wall version to confuse people.

The lharc program is really nice (though a bit slow) and I'd like to see it become a more widespread standard.

No idea, I had to set atx3 in my hosts file otherwise it would'nt login
correctly (the modem replies from atx4 were not recognised). I think you
can hit return when connected and it will be sent to the host (ie: it listens
to what you type while attempting connection).

>
> 3) While running poll.g (as per the short English docs) I get error

I have a 1Mb ST and I didnt get this problem. However, I was running with 150
extra folders (via ICD utils) and I had a lot of '40 folder' type problems
after running the package. I had to up it to 200, 250 and now 500 - so far
no problems.

> 4) My feed wants to be able to call me. Is there a way to make RUM
> go into a mode where it waits for incoming calls until I kill it?
No way that I know of.

> 5) Once I invoke login, it seems that I have to reboot to get out.

I would not call ZOOMRACKS II "HYPERCARD-like". It is a database system that uses some hypertext and stack concepts. However, it is nowhere near as flexible as HYPERCARD. It is really designes just for hypertext and database use. It's macro language is nowhere near as sophisticated as Hyperscript. It is text only, no graphics, no GEM.

483. Re: STadel SysOp Needs HELP!

Newsgroup: comp.sys.atari.st
Date: 1991-01-17 01:11:54 UTC
From: orc@vpnet.chi.il.us
Message-ID: <1991Jan17.011154.11747@vpnet.chi.il.us>
Source record: 235738

In article <1991Jan12.105730.44247@vaxb.acs.unt.edu> kenc@vaxb.acs.unt.edu writes:
>Can anyone give me advice on networking STadel board with TurboCIT or FredCIT
>ms-dos versions of citadel BBSes?

Stadel uses the C-86 style of networking, so if TurboCit or FredCit don't
do that flavour, it just won't work (unless you take the sources and hack in
the appropriate support.)

>Also, how many have gotten the UUCP modules to work?

I have, but that's not too surprising, 'cause I'm the author of Stadel...

>... but exactly how does the system know what and when to
>do it?

Well, that's where you get to play around with #events. You need to make
an event that does nothing more than shut down the BBS, then use something
like RUNIT to fork off uucall to call your news-site. (looking at the
docfiles for runit and uucall will prove helpful.) You also need to set
your feed up as a non-callable netnode from within Stadel, and all the
rooms you intend to share with your feed need to be explicitly netted
with that feed.

uucall is a master-only uucp, and it's only 1-window; you might, if
you're willing to play around, get better results with MAILTRUK (which
implements a 3-window, and is public domain) or dcp, using rnews to
glue the articles into the messagebase.

No, You can, however fit a single 5 1/4" half height or 2 3 1/2" hal height drives in the case. You may be further restricted if the drives are not imbedded SCSI, and you have to put a SCSI to whatever board in the case.

I will have to say that I have been quite pleased with mine. I used a QUANTUM PRO 80S. No problems for >6 months now.

486. Questions, things for sale

Newsgroup: comp.sys.atari.st
Date: 1991-01-17 02:36:07 UTC
From: sstreep@next.com
Message-ID: <193@rosie.NeXT.COM>
Source record: 235741

I have a few questions and a few things for sale:

1) I'm looking for a good music setup, both keyboard and software. Can someone recommend a good software package? I need both sequencing and scoring, although score printing is not _too_ important. I didn't like EZScore as it was pretty limited - no tempo changes, input was tedious, etc. Price is not
too important, and I'd like something that can go on my hard disk without resorting to a floppy disk key. (I have a mega 2, 60 meg hard disk, mono monitor)

2) What's a good value in keyboards? I need at least 8 note polyphonic, multitimbral, good rich sounds, touch sensitivity, and ideally something I can program patches for. Price should be under $1000 (well under, if possible), and I really have no idea what's out there.

3) Any Blood Money players out there? This is one of the most playable and enjoyable games I have ever seen, but what I want to know is: are there any cheats for this game? I eventually finished it without cheating, but there must be _some_ way to cheat! I did find one undocumented thing: If you press one of the function keys (f7, I think) shortly after the game starts, the game switches from 50Hz flicker mode to a 60Hz smooth display, which is much easier on they eyes at 3am. Don't press f10 as that bombs the computer!

4) Things for sale: I have complete developers docs (about 8 or 10 thick binders) with full Gem, gemdos, bios, hardware docs etc. I haven't used them for a year (since I have a 68040 machine 8^)) $65 / Best Offer

I also have GFA Basic 3 (Interpreter, compiler, resource construction program)
Prospero C, Prospero Pascal,
Prospero Fortran, Prospero Toolkit (assembler and resource construction set)
Word Writer 2.0 (all with original docs etc)
Make reasonable offer on all or part by email.

Sorry for the diversity of topics here (look ma, something for everyone)

Sometimes the only way to hit a monster with a fireball is to wait until it stands next to a wall. When the fireball hits the wall, it hits whatever is in the square, also. (Of course, some monsters have fire resistance...)

I find it faster to eat two fireballs and restart the game rather than try a warm reboot.

I've finished version 1.0 of my GEM-based exception handler and have uploaded it to atari.archive. It runs on my machine with TOS 1.0 in ROM without any problems. It is in file EXCEPT10.ARC.

This is my first upload to atari.archive. Did I do good by putting the file in the /atari/new directory, or should I have put the file someplace else? I assume that someone will move the file to the newitems directory sometime or was I supposed to do that myself?

You could also try some of the PC solutions to print Postscript, if you have a PC emulator board.

Another way would be to use Ghostscript, although I do not know what implementations are floating around for the ST.

Anyway, I have heard Imagen just had a new release of Ultrascript PC, so you may want to look into that.

496. Re: Prob with TeX 3.1/Metafont 2.7 for ATARI ST

```
>>>>> On 14 Jan 91 20:15:04 GMT, gulliet@rutile.enet.dec.com said:

/Jean_marc> Hi,

/Jean_marc> I have just upload TeX 3.1 from atari.archive.umich.edu.

/Jean_marc> When I try to run it, it complains that it doesn't find
/Jean_marc> the plain file (TeX and plain.fmt are together in the same
/Jean_marc> folder, D:\tex).

/Jean_marc> How can I define the environment variables, like TEXINPUTS,
/Jean_marc> within GULAM ? The very short documentation says:

/Jean_marc> setenv TEXINPUTS ./:/dev/D/tex/texinput (!)

/Jean_marc> Regards,
/Jean_marc> /Jean_marc.

There is a file at the atari archive at terminator in the TeX
directory called 'manpages.lzh'. This file contain manual pages
for TeX, Metafont and the other utility programs. The environment
variables are described there.

TeX knows about the four following environment variables (examples are
for gulam):

TEXFONTS
All font metric files (*.TFM) are searched in the directory
described by this variable.

ex: setenv TEXFONTS /dev/F/tex/texinput/tfm

TEXINPUTS
All TeX input and macro files are searched along the paths in
this variable.

ex: setenv TEXINPUTS .:/dev/F/tex/texinput/latyex/styles

TEXFORMATS
TeX loads the dumped format files (*.FMT) from this directory.

ex: setenv TEXFORMATS /dev/F/tex/formats

TEXPOOL
TeX loads the string pool file (TEX.POO) from this directory.

ex: setenv TEXPOOL /dev/F/tex

There are two noteworthy points about the examples.
```

1.) The use of the ':' as a path separator. This is due to the fact,
that the currently available binaries are the product of a quick
and dirty port to the ST from the Un*x sources. This also disables
the usual partition specifications like 'D:'

2.) The use of a '/dev/<partition>' notation. This is a feature of the
C library, which J.R.Bammi and E.R.Smith put together for GNU-C
on the ST. The code in this library maps the '/dev' notation to
TOS format before calling the actual system call.

I've currently produced new binaries, which now use the ';' as a path
separator and therefore allow the standard TOS notation for pathnames.
Also the new binaries don't discard *any* <CR> characters in the input
stream, but only the ones in a <CR><NL> pair. Also these binaries were
compiled with GCC 1.38 and maximum optimization.

I would be happy to submit these files to the atari archive at
terminator, if someone tells me the correct address for submissions by
mail.

I've also put archives together, which contains the C sources, which
were produced by the conversion process from WEB to C. These sources
may then be used the recompile TeX with differing internal buffer
sizes. (It is possible to compile TeX and Metafont on a ST with GNU-C,
but you need at least 2 megs for TeX and 2.5 megs for Metafont. The
compilation process takes about 1 hour).

I'm not sure about Harlekin, but I've found various auto folder programs and desk accessories seem to conflict with DC Desktop. I haven't quite tracked down the combinations yet but the symptom is essentially that the Desktop appears, but the mouse pointer doesn't move when you move the mouse, or sometimes it moves in a jerky fashion. Is this what you mean by "locks up"? Arbitrarily removing (or adding!) programs to the auto folder may fix the problem (as though some program had a page boundary problem or something?)

I'm endevouring to explore level 5 on Dungeon Master 1 and have got stuck a couple of times.

1. There is a room filled with teleports which I have tried every possible permutation to get through and can't.

2. There is a room with many pits which appear and dissappear. I got myself into the chamber on the top right corner of the room but there appears to be another chamber on the top left. How do I get to it ?

3. There is a small room with a portculis door at the other end over to the right. The door is opened buy a green button round the corner and you stand on a pressure pad as well. To get to the button you go forward, right, forward, pull a lever, turn through 180 degs, through what used to be a teleport and press the button. The teleport is now back in position so you cant go through it and soon as you step off the pad the door shuts again. Help !!!!!

Thanks for the rock monster advice. I'm geting the hang of it now although I feel the use of fireballs is cheating since ive not been given a fireball scroll yet !

>
> What is the best way to enter the world of MIDI? Namely, what program
>should I start with, with the considerations being price, ease of use,
>expandabilty?

Very hard to answer unless I know what you want to do. Do you want to compose?
Score? Arrange? Analyze? Experiment with computer generated composition?
Learn theory? Do you want to program, or just play?

I like Dr.T's software, and Tiger Cub is a good, powerful starter
sequencer. You can usually find it at mail order houses for ~$100.
Check out the November 1990 STart for a review, and the current
January 1991 STart for a demo on disk.

>What synthesizer should I get, within the above guidelines?

In terms of flexibility, the way to go is to get a MIDI controller,
and then use seperate sound modules. Again, many options. First off,
there are keyboard, guitar, violin, drum and wind controllers. The list
of sound modules is endless. Do you want to experiment with
synthesis techniques, or work with pre-programmed (or sampled) sounds?

>I already have musicological knowledge, so I'm not scared of staves and clefs.

You won't see many of those in most MIDI programs!

>How available is the MIDI book that was earlier stated to be out of print.

I assume you mean the Abacus book. I didn't find it very useful. Most
of the MIDI codes are listed in synthesizer manuals (from Korg and Roland
at least), and you really don't need to know much about them unless you
plan to start programming for MIDI. There are lots of other, better
sources for MIDI tech info.

> Is there a lot of specific talk on other nets? I'd hate to tie this one
>up on a tangential subject. Much appreciated.

Try music.comp or alt.music.makers.

From: rcd@cbnewsj.att.com
Message-ID: <1991Jan17.155900.15987@cbnewsj.att.com>
Source record: 235557

JMG Software's HyperLINK product appears to be the closest thing
to Hypercard for the ST. The following is excerpted from STart
magazine, Dec. 1990.

"This Hypertext-like product combines graphics, sound and data
manipulation. HyperLINK goes farther than frame or card-based
metaphors by allowing more direct interaction between different
HyperLINK applications; most of these applications can be generated
quickly and easily via HyperLINK's Builder function.

JMG Software
801 Mohawk Rd. W.
Hamilton, Ontario, Canada L9C 6C2
(416) 575-3200"

I have no affiliation with JMG Software, nor have I ever seen this

It currently supports None, XON/XOFF, RTS/CTS, or BOTH as per the ST's
serial routines. I don't know much about HP's ENQ/ACK; if you have
any info you can send me I will look at it and consider adding it in a
future version.

> 2) Why not Kermit? Will future versions support Kermit?

Why not? Because :-) I realize that there are some cases where Kermit
is the only choice (talking to IBM mainframes typically), but it was
basically a case of Kermit being the low man (frog?) on the totem
pole. XModem and its variants are in much more demand, and
consideration has always been given to the amount of memory occupied
by STalker (since it's primarily used as a GEM DA). If there is
sufficient demand, I may consider implementing Kermit using the
upcoming STalker 3's script language, or if I'm lucky, perhaps some
enterprising programmer will do it for me. The script language should
have everything needed for such a task. Right now I've got my hands
full working on ZModem, so don't expect to see Kermit from me any time
soon.

503. Installing A Printer

Newsgroup: comp.sys.atari.st
Date: 1991-01-17 17:08:52 UTC
From: darryl@yunexus.YorkU.CA
Message-ID: <20599@yunexus.YorkU.CA>
Source record: 235559

Hello.

I have an Atari ST 520 and a Panasonic 1080 (80 Column printer)
I am trying to get this working for a friend.
My experience with Atari's is very little.

When I try to print the screen to the printer, the computer seems
to think that the printer is a 132-column printer and does not
start printing at the left margin. Also a program called StoryWriter
similarly starts printing at about the center of the page.

With programs that allow you to install a printer driver, no problems
arise. The manual for the computer mentions a desk accessory called
InstallPrinter which is not available to me.

If anyone has any suggestions (HELP) or ftp sites where I can
download some appropriate software, please e-mail me.

>
>What other things? Perhaps 16 color ANSI emulation? Zmodem batch??

Development on PC-ANSI for STalker 3 is already complete. This was essentially a tweak of the VT100 code, plus support for translation tables to/from the native ST character set and true IBM fonts. STalker 3 supports the use of monospaced GDOS fonts, and an IBM GDOS font has been created for optional use in PC-ANSI mode. Alternatively you could use something like Harlekin to change the system font to an IBM one in order to get all of the IBM characters in PC-ANSI mode.

The current version of STalker's VT100 and VT52 supports the colour setting sequences, although the support is restricted somewhat by the GEM VDI. The character colour can be changed (16 colours are supported, although a request for 'white' is mapped to black) but the cell colour cannot; VDI does not provide a way to do this.

ZModem (and YModem-G) are currently under development.

505. Simple data plotter

Newsgroup: comp.sys.atari.st
Date: 1991-01-17 17:15:39 UTC
From: dejesus@bourbon.ee.tulane.edu
Message-ID: <5727@rex.cs.tulane.edu>
Source record: 235561

Does anyone know about any simple PD/Shareware utility (or source code) that will take in a data file of x-y coordinates and just plot them to the screen? The data file format does not matter since I will be making my own program that will generate it and write it to disk. It can be for any ST resolution. It does not need to draw curves or splines between the points, just to plot them one at a time. Thanks in advance...

>text, but the standard size desktop icons...

I've seen that sort of behavior with a multisync monitor. Something having
to do with the detection circuitry getting confused, and using the wrong
horizontal scan rate, so the resulting image only took up half the screen
(and was half as wide). This was strictly a function of the monitor, the
computer had no idea anything was going on.

For sequencing I'd recommend Alchimie Jr., a shareware sequencer currently available on GEnie's MIDI RT (and at atari.archive when I figure out how to get it there w/o FTP access). It doesn't do scoring, but it will export standard MIDI files, so maybe Copyist could print the files.

>2) What's a good value in keyboards? I need at least 8 note polyphonic,
>multitimbral, good rich sounds, touch sensitivity, and ideally something

For a single keyboard, I was impressed with the Roland E5 Intelligent Synthesizer ($899 locally, $1499 retail). It is full-sized 61-key velocity sensitive. I don't know about the patch capability. However, I've opted to go another route which is both cheaper and more flexible - I purchased a Yamaha PSS-790 ($249), which has _excellent_ sampled sounds, phenomenal rhythm section programs, _28-note_ polyphony, a built-in 8-track sequencer, full 16-channel MIDI, but lacks velocity sensitivity, full-size keys (they are mid-size), and the ability to do patches. I will add to this a Yamaha or Roland digital piano for ~$350, which will have full-size velocity-sensitive keys, and use it to control the superior sound and rhythms of the PSS-790. You could probably add a separate sound module with the ability to do patches and have an even more flexible system, still under $1000.

511. Spectre and TOS simultaneously

Newsgroup: comp.sys.atari.st
Date: 1991-01-17 19:12:45 UTC
From: ramsiri@blake.u.washington.edu
Message-ID: <14599@milton.u.washington.edu>
Source record: 235567

When you install SOFTLINK.prg (partitioning software),
your first installation of each partition requires
a BOOTING of the partition. This makes me wonder if
Spectre wouldn't work in one partition while
TOS is running in another partition.. if not,
why not... and is there a possibility for it...

Imagine a TT, some kind of partitioning software that
allows for Spectre, TOS and MS-DOS .. seems like
it could be done.. i suppose this has been brought up
here before..

-kevin

Because NOTATOR requires the DONGLE copy protection and
the GCR also occupying the port.. there would have to
be some code that would allow both cartridges to be
read without disabling one for the other.

I use Moshe Braner's GNOME (Generally Not the Original MicroEmacs).
In the UK it's available at the National Public Domain Software
Archive at Lancaster: uk.ac.lancs.pdsoft (login as pdsoft with
password pdsoft). I don't know about elsewhere. It will run as an
accessory or a program. It can also be compiled for MS-DOS and Unix.
Moshe used to provide a floppy with the latest version on for a
small handling charge, I don't know if he still does. He is/was
e-mailable as braner@batcomputer.tn.cornell.edu

> -- thanks, Dave / Gadgets

Well, the 68010 is pretty much obsolete, but it at least *can* be a little faster than a 68000. Too bad there are no 16MHz 68010s. (Why is this, I wonder? Why fast 68000s but not 010s? Oh well.) From what you've said, can we infer then that creating a socket for a 68010 in an STe should be a completely trouble-free operation? (You realize, of course, that I'd give this up in a second if I could get that 68030 board.... }-)

>PostScript files on the ST?
>
>Thanks for the laughter,

You might look into a program called UltraScript by IMAGEN. The original version of this program allowed the Atari SLM804 laser printer to print PostScript files. An ad in the April 1990 issue of STart lists a version that supports other printers, including "virtually any dot matrix" printer. I assume this means Epsons.

The list price is a little steep (~$200 US). I also imagine that it requires a butt-load of memory to run since all of the PostScript processing has to be done by the ST (a task usually left to the very expensive PostScript printer).

The address listed in the ad is as follows:

IMAGEN Corporation
PO Box 58101
Dept. USST
Santa Clara, CA 95052-8101
(800) 635-3997
(408) 986-9400

I do not own this program, so I have no idea of how good it is. I am not associated with IMAGEN in any way....etc....etc....

Hope this helps.

Your pal,
Mike Goo

I bought 1Mx8 80ns, since they were pretty cheap. (I saw some 100ns for
sale, but no one even seems to sell 120ns or slower.) As for cost, in
the US the 9bit SIMMs tend to be 25% more expensive than the 8bit ones.

Notator is of course the most powerful notaion program in the Atari
world. It'll make you wonder how a 8mhz 68000 can do all that ;->
It's also probaly the most powerful sequencer bar none. The only
thing I would not recommend it for is if you want to do a lot of time
signature changes. I don't but it doesn't look as flexible as it
should (any comments out there?). Luckily there are quite a few
other choices, Dr. t's etc if you don't want the fairly steep
learning curve, although it is a very satisfiing program to work with
because it's so logical and flexible. It just has a LOT of features.

517. STalker & STeno

Newsgroup: comp.sys.atari.st

From: ramsiri@blake.u.washington.edu
Message-ID: <14622@milton.u.washington.edu>
Source record: 235576

Softlink doesn't need the NOTATOR dongle to run.. so
i booted with softlink in my auto folder....
this creates 3 partitions for me.. the first auto booting
into GEM (as i have it set).. then i booted the second partition
and ran SPECTRE... yes.. and booted into MAC mode...
as far as i know.. partition 1 still was running GEM...
I couldn't SWITCH back to partition 1 because the PLUS keyboard
assignments take over and eliminate SOFTLINK's R-SHIFT-keypad
used for changing partitions...

seems like David could work with this and give us a way
to switch between TOS and MAC...!

-kevin

i wrote to him about this.. hopefully he will respond shortly...

> a local repair shop, but later found out the guy had never worked on
> an Atari. It took him 2 MONTHS to finally say to me "It's a bad floppy
> drive. You need a new one." ...

I had some problems with my 1040ST (in fact on two machines out of 25 ...)
and found that the culprit was the mass contact under the drive.
The electrical retuen link is done by a a brass stub that also hold the drive.
The contact is done by simple pressure, and with case deformation, it get
loose. On my machine, I soldered (!) the brass to the board after careful
cleaning. On the other, cleaning (with steel woole) was sufficient.
The symptoms (before repare) was that the disk would work some time, then
only occasionaly, then not at all, or just for a few second when you try
to twist the case. Since the repair (~18 month) NO PROBLEM ! Have you
checked for that ?

As I have take my drive in and out many times for the repair, I can ashure
you that replacing a drive by an other from the same type should be very easy
(I would probably get it from a GOOD ATARI Dealer (if this exists in your place)
Here in Switzerland, I saw them in my dealer shop, but probably around 140-160$.

Hope you can repair your Atari (We use ours 8hours/day as terminal and love
them !)very soon and without paying a cent to your UNDealer !

Regards, Paul.

>Hello,

yo...

> I am trying to write a shell program (due to the idiosyncracies of gulam),

join the club...i, too am doing this, which makes me wonder why we can't just start with gulam source (unless, of course, the author used ATT/BSD code :-).

>I have made several attempts to do input/output redirection with varying degrees
>of success. Please could someone out there tell me the 'proper' way to redirect
>IO before a pexec call (thinking in terms of a shell program). Do you have to
>preload the program, do the redirection, and then re-pexec, etc.

normally, u use Fdup/Fforce to force stdin/stdout/stderr handles to open file handles. the shell opens the files before the Pexec and closes them after. i don't have code handy, or even a man page, so in general, do:

1) parse cmdline, looking for redirection

2) if so, open the file names (or pipes)

3) Fforce std device handles (stdin, etc) to the open file handles (i would think about opening the files binary, rather than text, as well)

4) set up the command and do the Pexec

5) on return, close the files.

note that i recently posted a reasonable popen/pclose, though the MiNT versions would be better.

you can also do something like this:

```
sprintf (pcmd, "%c%s %s >file", (char) strlen (cmd), cmd, args);
Pexec (..., cmd, ...);
```

tho i have only been able to redir stdout this way (not stdin). this is probably not recommended, at least by me (and doubtless those code police out there who will no doubt jump on me), but it is quick (and dirty). this does not work for all programs. the Fforce should, however.

i have written a tiny shell, invoked by my cc(1) to start the various passes of alcyon, which normally cannot be redirected by gulam. i can mail it to u if u want.

along these lines, for those of u that are writing a shell, i would offer these suggestions, based on lack of features in gulam:

1) pipes are a must, i.e. "ls -l | grep xxx | wc -l"

2) args in quoted strings include spaces, i.e. grep "a string" file passes "a string" as a single arg to grep, with an imbedded space

3) make it portable

4) support MiNT (and add job control, if possible)

5) RELEASE SOUCE CODE!!!! then the rest of us can improve your work (and be more productive, since YOU also benefit from these improvements)

6) personally, i like history accessible via emacs/vi/cursor keys a l tcsh/ksh.

7) command prompt should be able to deal with imbedded escapes (i.e. ESC p/ESC q for reverse video). gulam gets confused

8) make it possible to redirect inside scripts

9) make it possible to do things like "sh file" (or, if memory serves, "echo 'command' | csh -s")

10) loadable common programs (cat, ls, grep, etc) which stay in memory (i'd rather have them in /bin, too)

11) support something like SLASHCHAR env variable, so cmd lines can use either "cmd /path/file" or "cmd \path\file". shell translates according to SLASHCHAR before exec'ing cmd. it would be nice to support alternate device names, e.g. "/dev/c" for "c:" in cmd lines and scripts.

12) soft links would be a definite plus, if u feel ambitious...

these are some of the things i would do to, if/when i write my shell. i would also do away with builtin emacs/file xfer, etc. there are plenty of good standalone codes for this. still, gulam has served us well for all these years. and it is very solid, at least in my experience...

pleasant programming....

>small and (debatable) benefit. Not a win, IMHO.

who decides what/how much benefit something is? you? i hope not. it IS a win, and for me, at least, a relatively large benefit.

it would probably not break any existing code. if so, how? and it is a BIG win, IMHO. don't knock it 'til you've tried it. besides, it could be written to be configurable from a system call, telling BIOS or whatever to turn it off (from the desktop/desktop.inf even). in fact, taking any code to force upper case out of the ROM code will probably make it _smaller_. i see no reason the BIOS can't deal with 'a' as easily as with 'A'. it just expands the legal chars from 26 to 52 (plus other legal filename chars). and it would not break any code i write, nor probably any GNU code, or MiNT, or gulam or most TOS code i can think of.

>Also, Some people LIKE case insensitivity (ever heard of VMS? :^)

and some people LOVE case sensitivity.

oh, this IS rich... a unix bigot (me) and a VMS (all caps :-) bigot...

so, just set yer CapsLock (or CAPSLOCK, tho the key on my mega4 is at least labeled in mixed case :-) and let the rest of us work the way we want to, not the way ken olson wants us to :-).

if VMS is so great, why are all the (major) shells and TOS utilities unix-oriented then? if u think most people crave VMS, why not write a DCL shell and a SYS$ library for the ST? what about EDT or TPU? u could probably make some money if you do, assuming there is a market (there probably is).

i HOPE u are not saying: "i can't have it, so u can't have it either"...

and lets not start a VMS vs unix religion war here. one war a week (i.e. persian gulf) is about all i can handle. i just asked a simple question and got the answer (from apratt and others) i expected. there is no need to follow up on this note, unless u are offering suggestions on how this can be implemented or why it can't TECHNICALLY be done...

Source record: 235584

well, it seems i am not the only nut out there who has problems with lharc files...

note that since most computer disk systems allocate block of space for files (i.e. to store 1 byte requires an entire block, which is 512 or 1024 bytes on "normal" STs, i forget which, and more like 8k on unix systems), including the st, than it is very likely that lharc is really not saving as much space on disk as u might think, on average. then, the only benefit of lharc at this point is that it may be somewhat faster at extracting files from archives. i'd rather have 1) faster archiving, 2) solid software, 3) compatiblility than this increase in de[lh]arcing speed...

i think the problems with lharc will eventually be solved. i just think we rushed into it as our defacto standard about a year too early...

I wouldn't be surprised if lots of programs force filenames to all upper or lower-case, because it's now legal and it makes them easier to compare. You'd never know until you try, and discover that half the applications that you didn't test don't work anymore.

Example: remember all the .TTP programs that didn't work right from the desktop because it uppercases the argument string? I found such a bug in a major ST application installation program that I beta-tested.

Yech. Let's encourage Atari to give us something useful, like say one big master-ROM-patch that would be updated frequently and contain all the patches that all versions of the ROMs need.

Source record: 235587

ywrpiero@ubvmsc.cc.buffalo.edu (Mark Pierro) writes:

- I have read with great interest the discussions here on STalker/STeno -
- I have been seriously considering getting this package but have had one
- reservation. Since I only have 1 meg of memory, I was concerned about
- having STeno loaded while running STalker and still have enough memory
- for other applications after quitting telecommunciations.

I have one meg on my STe. I run about 200K worth of hard drive cache
and NeoDesk installed, not to mention a few other little things.
With STalker and STeno, I have about 100K free. When I'm not doing
telelcommunications, I reboot and change my configuration with
Superboot. Once I get two megs, I'll probably stop rebooting. But
even now, I have enough room to load programs like DC Xtract 2.0 and
other utilities.

- Therefore, my question is: Do you need STeno to act as a capture
- buffer when running STalker or does STalker have its own, built in
- capture??

STeno is the capture buffer; STalker does not have its own. On the
other hand, STalker does have an "ASCII Receive" feature which lets
you save the incoming text directly to a text file. Once you open
it, it only closes the file after you tell it to or when there's no
more space on the disk.

GNU Plot sounds like what you're after. It will take data files, plot functions and do so on a variety of output devices (such as the ATari ST screen, a file of Postscript output or an Epson printer). It was recently posted to comp.binaries.atari.st and should also be available on atari.archive.

>any info you can send me I will look at it and consider adding it in a
>future version.

I don't have any technical info on ENQ/ACK; perhaps a fellow HP-ite reading this can help out. ENQ/ACK is an abomination left over from the days of the HP3000 (a very good mainframe business computer). The 3000 I/O systems required ENQ/ACK handshaking with their remote terminals. (Why they couldn't use just RTS/CTS or XON/XOFF, I'll never know. Maybe because that's the way HP ran their computer bizniz back then...) Anyway, ENQ/ACK acquired a life of its own, and now, even though it's not needed in our new computers, people keep building it in as an option. Someone on this site decided to exercise that option, and so here I am.

Don't worry. Uniterm doesn't have it either. Nor does Flash. I've seen one PD termulator with ENQ/ACK, but it didn't work very well.

>soon.

I see. I don't know how much demand there is for it. Kermit is awfully slow, compared to other protocols. HOWEVER, on the question of code: there is a book by Frank da Cruz, called "Kermit: A File Transfer Protocol." I leafed through it once, and it had a lot of code (Pascal? shell script? not C) in it -- it looked like enough code to build an entire Kermit.

Thanks for responding. The combination of termulator/editor, especially as desk accessories, sounds intriguing enough to me.

Source record: 235593

David Parsons: (my mail router from school didn't know your domain, so I'm posting this to the net. Hate to waste the bandwidth, but...)

David,
I've got a uucp feed available, and I'd like to use uucall. Following the directions, I've made my uucp.ini file and my uucp.sys file, and just to make sure, copied that all into my spool directory, which is also defined as my network folder.
Also following your examples, I am running citadel from within the script file, and that works flawlessly. The problem comes when I actually CALL uucall. I repeatedly get the 'usage:....' message.
I have frontier AND uucp both defined in my uucp.sys, (as the same thing), but when I run uucall with this:
uucall -suucp -x
it gives me the usage notes. Hmmmmm....Okay, first I looked in the docs, and there's no mention of what command-line arguements are what. I tried just the -x and just the -suucp. The only thing that provided any response other than the usage note was 'uucall -x' That tells me that no system was selected, so it's cleaning up. *sigh* Am I being incredibly stupid here or what?
If you don't mind, I'd like to get the source from you. That would (perhaps), let me dig things out myself and not bug you. I looked on terminator, and on wuarchive, and there's no source to stadel.
If it matters, I have access to uue/uud, compress, zoo...whatever.

538. Novice questions about ST's and MIDI

Newsgroup: comp.sys.atari.st
Date: 1991-01-18 10:52:03 UTC
From: SRPDSDJ@trev.dsir.govt.nz
Message-ID: <7950@trev.dsir.govt.nz>
Source record: 235594

I have a series of questions about MIDI and Ataris in general.

Where I live the salespeople are basically unctuous, arrogant, facile fools
and will not aor perhaps could not answer my questions :-(.

What I want to know specifically is the following.
1) is a 520st powerful enough to run MIDI software. If not recommendations.
2) can a non-atari hard disk be installed on an atari. How and which ones.
3) " " " monitor " " " " " " " "

I am connected to the net but only via an IBM PC clone (386sx 80Mb HDD hence
the reason for asking about the hard drive above, I hate running machines
from floppies they are so slow in comparison, :-))

4) Can this IBM clone uudecode, unarc, zoo extract etc, files from
comp.binaries.atari.st and then save them in a format that the atari
would then be able to read (I have a 3.5" floppy drive). If not are there
any work arounds.
5) I have only recently begun reading this newsgroup, if there is a
freqently asked questions file can anyone forward this or point me in the
right direction.

All replies by email would be greatly appreciated?

GNUplot is a nice package indeed! BUT .... it refuses to plot negative points when you give a data file. Worse, it takes a (X,Y) and plots it like (|X|,|Y|)..... I've send mail about it, but never received any reply.

The ST can handle PC disks, so format disks on the PC and copy files
from the ST to them.

There are other options -- special formatting programs exist, and TOS
1.4 generates PC formatted disks automatically -- but this always works
(so long as you have a double-sided ST drive of course!).

>or the Meg a Minute by Dave Small from Start Mag...

You must have a rather complex set up. Turtle is designed to run in
1 meg systems, since that's all I have. I also back up entirely on 800K
disks.

You can help relieve a cramped system by placing the RAMdisk in your
auto folder, rather than allow Turtle to install it. It does use less
memory that way. The RAMdisk is a normal and fully functional one
which I use al the time as a fast scratch drive. It does not, however,
do any autoloading of files at boot time.

If you do use the RAMdisk in your auto folder, you'll need to set the
proper configuration when you want to back up. Hold down either shift
key when the boot process approaches the RAMdisk. If a shift key is down
when the program starts up, it will present a configuration menu.

I run Turtle in a 1meg ST with the Twistered RAM disk.

I have not tried Vault but have used Meg-a-Minute. MaM was okay, but
I'm not too excited about having Image copies. Turtle is nice in that
any file is accessible via TOS copy.

>Say, you're not supposed to be selling that GNU stuff!

The Preamble to the GNU License explicitly states that you're ALLOWED to
sell GNU software. If Ken finds somebody who's dumb enough to pay for
GCC, fine. Serve him right.
TeX, on the other hand, is not GNU software. There are many commercial
versions of TeX (who buys one when he can get a PD version ? Probably
people who are scared of viruses).

From: bdm@sirius.rice.edu
Message-ID: <1991Jan18.164035.10583@rice.edu>
Source record: 235654

Quick question...how do I know which version I have? I thought it
would be on the ABOUT TOS window, but no. Given the methods of Atari, I assume
the age of the computer is rarely helpful in determining this, but
I bought it in 1988. Perhaps the default date tells, which is 4/22/87.

Have you guys ever heard of Cubase 2.0 by Steinberg Software? It also
has notation capabilities up to the level of professional use.
It is also cheaper than Notator, at least here.
As a sequencer Cubase is the ultimate choise for a pro-level musician.
It is very easy to use and uses the special features that ST offers to
give the best flexibility to forget the program and concentrate to creating
music. I have used both Notator and Cubase and guess which one got kicked out?

I am not connected to Steinberg in any way, just a very happy end-user.

>for other applications after quitting telecommunciations.

1 meg is plenty, depending on what other apps you plan to run with STalker/STeno loaded. Calamus users and others who want as large a workspace as possible often reboot without any ACCs at all, it's up to you. You can always run either as a .PRG just by renaming the file. Using STeno as a .PRG is a good compromise since it lets your capture area be as big as the available memory. As an .ACC, STeno has to allocate all of its space at boot time, so a 100K edit buffer eats 100K of RAM.

STeno's minimum config is somewhere around 90K total consumption. That gives you a 32K edit buffer, allowing files up to around 28 or 29K to be edited (i.e., there's some storage overhead).

STalker 2.0's minimum config used right around 100K or RAM grand total (that's with an 80x24 virtual screen and a 4K transfer buffer). The current version 2.06 is somewhere around 125K minimum due to all the new features that were added around 2.04. Note that unlike Shadow, a small file transfer buffer does not limit your file transfers in any way. It simply means that it will get flushed to / read from disk more often than with a larger one.

>Therefore, my question is: Do you need STeno to act as a capture buffer
>when running STalker or does STalker have its own, built in capture??

No, you don't need STeno at all. They're independent programs that happen to take advantage of each other's presence. Without STeno loaded, STalker's capture command is simply not available. I myself use capture sparingly and rely instead on STalker's scroll-back buffer. If you've used xterm you probably have an idea of what this is like. As lines of text scroll off the top of the STalker terminal window they aren't lost; you can configure up to 2000 lines in the buffer and can then scroll back and forth over the received text. You can even use the mouse to grab a chunk of it and then save it to disk, print it, or fire it off to STeno for editing.

You might consider the scroll-back buffer as a limited size, read-only capture buffer. You can also capture to disk (called ASCII-Receive) if you like.

...hope this helps,

Eric

551. MIDI percussion track

Newsgroup: comp.sys.atari.st
Date: 1991-01-18 17:46:02 UTC
From: bill@mwca.UUCP
Message-ID: <1796@mwca.UUCP>
Source record: 235657

Having recently purchased a Yamaha PSS-790 synthesizer, I've found that most song files with percussion tracks sound terrible (naturally, because the keyboard mapping of drums to keys on the Yamaha is different than a Roland or Casio). So, is there any relatively easy way to modify the song file to sound decent? Or is there basically no way to know whether a C# on the percussion track is supposed to map to a bass drum on the original synth and a G# is a high-hat...the resulting cacophony of drums, bells, whistles, and voices is interesting, but surely not what the original musician intended!

>
>>it would probably not break any existing code. if so, how?
>
>I wouldn't be surprised if lots of programs force filenames to all
>upper or lower-case, because it's now legal and it makes them easier

yes, but i also mentioned a (new) backward compatibility GEMDOS call (e.g.
int Fcase(int on)) which could be called by the deskop (like toggling
the blitter) to toggle do it/not do it. if on != 0, the the code to
upcase in TOS would be bypassed. if on == 0, then it would be executed.
i.e. business as usual. and (well-written) new programs could test the
TOS version before making this call, just as they do with the new calls
added to the Rainbow TOS. simple (i think...). surely THAT would not cause
any existing code to break, at least for this reason. if u happen across
a program that does not work, u always have the option of turning off
case sensitivity. i believe there were probably codes which broke with
the blitter turned on, but u have the option to turn it off in a similar
fashion. we are not talking about a major change to TOS here, just a
relatively small amount of additional code. but i agree that such a change
should not be made if it breaks (important) existing code or just to
please me :-).

>Let's encourage Atari to give us something useful, like say one
>big master-ROM-patch that would be updated frequently and contain all
>the patches that all versions of the ROMs need.

yes, this is a good idea. it would make it very easy to customize a
system, too.

That date is the date of the Mega TOS release (TOS 1.2), so that's probably what you have.

The definite way to tell is to read the OS header. A pointer to the OS header is at $4f2, and the TOS version number is found in the second word of the OS header. For example, $0102 there means TOS 1.2.

Yes. Well, almost. For best results, format the disk on the IBM in 720K format. The Atari and the IBM have slightly different ways of storing the directory (among other things.)

Also, do *NOT* (I have) try to use "alternative format" (i.e. Twister, etc.) Atari ST disks on the IBM, they do weird things.

You can interchange 3.5" DD disks between STs and PCs *IF* the disk was formatted on a PC. If the disk was formatted on an ST, the PC can't read it, but the ST can work just fine with PC-formatted disks.

```
THE REAL LYNX TECH SPECS (inquiring minds want to know!)
--------------------------------------------------------

(gathered from Jan/Feb issue of Atari Explorer)

1) 16MHz system master clock; 65C02 CPU clocked 2 4MHz
2) 64K RAM clocked at 4MHZ, optionally 8MHz for same-page accesses
3) 4 shift-register sound channels, support for 7-bit digitized sound
4) ComLynx bidirectional serial I/O from 300 to 62.5 KBaud
5) 256K of ROM per game cartridge organized as a disk-like filing system
6) 1/2K of bootstrap ROM
7) RGB resolution of 160x102x4 bits, 16 12-bit color registers
Resolution of 480x102x1 is possible, but experimental
8) 2 custom chips; "Mikey" contains 65C02, DMA, bootstrap ROM;
"Suzy" contains multiply/divide unit and blitter, which
supports translation, scaling & collision detection for
objects up to 64Kx64K pixels.
9) Each video screen takes 8K.
10) Development system is a parallel-interface Lynx emulation module with
hardware debugging features & traceback. Devkit currently runs on Amigas
(3MB ram and hard disk) only.
11) The developer's kit: libraries, docs 'n hardware is $5K. Cheaper versions
without hardware debugging are in the works.
12) The Lynx was developed in 2 years at Epyx. Jay Miner did the custom
chips, R.J. Mical headed software development. Steve Landrum worked on
the Developer's Suite in addition to writing the "Blue Lightning"
cartridge. Jay and R.J. are notable for the Amiga custom chip set and
windowing software, respectively.

I understand that ICD does not release their software to drive this device
either, so you may be stuck with buying theirs. If you do manage to get
a driver for tape backup, please post about it!!

- You can interchange 3.5" DD disks between STs and PCs *IF*
- the disk was formatted on a PC. If the disk was formatted on an ST,
- the PC can't read it, but the ST can work just fine with
- PC-formatted disks.

Lemme add that you CAN format the disks on an ST, but there are
restrictions. The disks must be formatted 80 tracks/9 sectors and
they must have an MS-DOS-compatible boot sector. TOS 1.4 and greater
will do this automatically; for TOS 1.0 and 1.2, you must use
something like DC Format and its MS-DOS boot sector option to create
the compatible boot sector.

>slow, compared to other protocols.

Kermit is just as fast as any other protocol if you have a newer
version which accepts large (at least 1-2K) packets. This is
especially true if the Kermit also implements sliding windows.
Uniterm has the former, but not the latter.

Would that be TOS version 1.2? Anyway, there is a program called
'tos_vers' under the 'utilities' directory on atari.archive which will
tell which version of TOS you have. Good point though - if Atari
would tell you the version in the 'About ...' dialog, life would be
simpler!

>Thats *wonderful* news :-(So how do you cope with your source on one
>partition and your system on another without cd'ing to the system partition?

I'm sorry for not making it clearer. In this system, /dev/<letter> is
the way of specifying a disk drive. For example, termcap (should) take
any value for the environment variable TERMCAP beginning with a slash
as a pathname, and any other value as an actual termcap entry. If you
keep your termcap database in e:\etc, try

setenv TERMCAP /dev/E/etc/termcap

I hope that this makes it clearer to everyone.

I am wishing to upgrade from WWST 2.03 to something that will format margins on individual paragraphs, autofootnote placement, preferrably wysiwyg, with perhaps something like outline GDOS output.

I am considering Script, Signum II, Wordflair, Calamus Text Editor, Write On, That's Write!, Tempus Word, OR ANY OTHER that will do what I need. So; if you have worked with any of these, and would like to send me e-mail reviews/ opinions, or post them, or send me a review that you have on disk, that would be much appreciated! Also, if any of the companies, or distributers of the above, or competeing programs see this, email me to tell me how I can get info on the capabilities and output (I have a 24 pin Epson LQ 510 printer) or even a demo of the program, I would much appreciate that as well.
Thank you all!

From: ramsiri@blake.u.washington.edu
Message-ID: <14749@milton.u.washington.edu>
Source record: 235688

I am trying to decided which archiving program will do the
best job as well as handle a large argument list:

I have a set of files (400+, abuot 4.5MB) that I am constantly accessing
and updating... generally, each time i edit a file, i save
it to two places.. this takes some time.. i would prefer to run
a gulam script at the end of my session that would COPY
one set of files into an archived set of the same files..
refresh them etc.. Problem is not knowing which program
can handle a directory with a set of about 9 subdirectories and
several hundred files...

Is this impossible to do with ZOO ro LHARC or ARC? I don't
think my version of zoo can handle more than a few arguments.
Are there versions that can handle this?

Thanks,
-kevin

From: thinker@ucscb.UCSC.EDU
Message-ID: <11301@darkstar.ucsc.edu>
Source record: 235690
Cross-posted to: comp.sys.atari.st,rec.games.misc

If anybody out there has Ultima III for the ST, I would be interested in purchasing it. I've solved it for the Atari 800, but I want it for my ST archives. I have requested a conversion for the ST from Origin Systems, but unfortunately, although I have all the original documentation, I lost the actual disk some time ago. Without that, they won't give me a conversion, and I'm not too eager to go out and spend $25+ on a completely new package of a game I've already solved. Please mail me if you're interested.
By the way, does anybody know if and when Ultima V will come out for the ST?

-Vince M.

From: ramsiri@blake.u.washington.edu
Message-ID: <14770@milton.u.washington.edu>
Source record: 235692

Forgive me if these questions have been "overly" covered:

1) What "kind" of ST RAM, TT RAM and VME RAM will the TT/030
take? simms, i hope.. but an article i read today in
Atari EXPLORER Jan/Feb gave me the impression the TT fast
RAM was DRAM?

2) Is the buyer of a TT stuck with having to purchase a 720k drive?
Will a 1.44 be offered?

Which leads me to my third question:

3) I would be interested in buying the TT if I could buy it
without a monitor, a HD, and without the 720k floppy...
also, without RAM.

My dealer says they will have to sell the way ATARI ships them..
(if they ever do).. is this "ATARI" policy or "dealer" policy..?
I can't seem to get a straight answer.

Thanks

-kevin

588. 3D

Newsgroup: comp.sys.atari.st
Date: 1991-01-20 19:19:37 UTC
From: jimomura@lsuc.on.ca
Message-ID: <1991Jan20.191937.4211@lsuc.on.ca>
Source record: 235695

As far as we've seen so far, no one has been able to maintain a sustained interest in 3D technology in fields of entertainment. Every time I see a new attempt at this technology, I expect it to be a "flash-in-the-pan" novelty. Yet it would not surprise me to see a more permanent sustained interest in the near future. In the Toronto area, at Ontario Place, I understand there is going to be some new 3D Imax film being shown in conjunction with radio controlled stereo glasses similar to the ones that Sega sells. But that is not in itself significantly more than what has been attempted before, except for the provision of high cost, high technology glasses for each individual in the theatre, without substantial modification to the theatre itself. Keep in mind that it would have been possible to use the actual Sega style glasses without radio control simply by wiring a plug for each seat. But that approach lacks portability, and it would be expectable that the company or companies involved in this new venture are looking at the possibility of taking their show "on the road."

It should be noted that in theatre showings, I would not expect the image to be much better than a use of polarized stereo glasses which are far cheaper to produce, though, either is significantly better than the magenta/cyan glasses which are the least expensive technology for home use.

A couple of years ago I had the chance to use the Stereotek glasses on an Atari ST, and not surprisingly, they were first rate. With no significant ghosting on the screen I viewed molecular models which floated in the air in perfect clarity. Furthermore, we have CAD-3D version 2 which supports these glasses, though I haven't had a chance to try this combination. But for the Atari ST, nothing else seems to have followed, and indeed, I don't know if the Stereotek glasses are still being sold. In the long run, this shouldn't matter since the technology should not be hard to reproduce now, or at some future date, but anyone with reasonable resources.

Recently I purchased a Sega Master System 3D adaptor and a game (Zaxxon 3D) which was on sale, and probably an end-of-line clearance. The adaptor used the old Sega "credit card" port leaving the large cartridge port free for software. But the glasses themselves are not tied to that adaptor. The latest version of the Sega Master System (SMS II) no longer has this card port, so it would be expected that production of this particular 3D adaptor has probably been discontinued. On the

otherhand, the "base adaptor" for the Genesis does have the card port, so old adaptors can be used on the Genesis, and Sega could easily create a new adaptor for the Genesis and even for the Master System II, if they wanted to do so.

With my previous experience with this technology, the question I had was why Sega had been so relatively unsuccessful in selling their version. Was it just price? Well, having played Zaxxon 3D, I think this was the case. The game itself was generally fine. The 3D imaging was not as good as on the Atari ST, but not so bad as to be unpleasant to use. First, the Sony TV I used seemed to leave just a bit of ghosting that I don't recall seeing on the Atari ST monitor, and second, the lower 256 * 192 resolution compared to the Atari (which I assume was probably running at 640 * 200). Looking at the Sega catalogue though, there were only a couple of other programs written for the 3D system. The other one that shows promise is Space Harrier 3D. I don't expect the Missle Command 3D system will benefit from the 3D rendition.

But the problem is clear. It is comprised of the usual "Catch-22" which is commonly a part of many marketting failures. 1. You can't see the benefit of the system until you buy it (because most stores won't set it up for you to test) so you don't develop a desire strong enough to overcome the price of involvment, and 2. Since you don't buy it, support doesn't take off sufficiently to create a stronger desire to have it.

I think this could have been overcome. The solution is actually fairly simple, and I'm surprised that Sega, and Atari ST programmers both seemed to miss it. It has a precedent too. That is, "stereo music." Now, the trick is that stereo in part took off because you didn't have to have a stereo player or radio to listen to stereo music. If Sega wanted to create a market for their 3D system, they merely had to add a few 3D options to the games they brought out in 2D. This didn't have to be a part of the main game play. Adventures in particular were the best target. In them, the graphics are already primarily ornamentation (in reality, unnecessary to the game itself), and mainly not animated. It would not have been hard to add some 3D elements which could be selectable by the player. It could cost a bit in ROM storage, but that could be minimized. Certainly some "magazine writers" would have griped about only having partial support of 3D in some products, but in the long run, it would have built up confidence in the 3D technology and increased the user base of 3D owners, and thus making it worthwhile to create more fully 3D products.

Anyway, I think that if anyone is interested in taking another shot at 3D support, there's probably a way to do it profitably.

>> when running STalker or does STalker have its own, built in capture??

Nope, the look back buffer in STalker can function in the same way.
You use ALT-Mouse drag to select an area of text and then are given a
choice of saving to a file or printing or pasting to STeno (in case
capture is OFF in STalker).

591. EXCEPT 2.0 - The accessory version

Newsgroup: comp.sys.atari.st
Date: 1991-01-21 00:03:52 UTC
From: jlf@cs.wvu.wvnet.edu
Message-ID: <1211@h.cs.wvu.wvnet.edu>
Source record: 235698

I've just uploaded version 2.0 of Except to atari.archive. It works essentially the same as version 1.0 except it is now an accessory and it has some new features:

- You can lock Except's vectors in place thus preventing some other program from stealing them away.

- You can 'turn off' Except's handling of exceptions. Version 1.0 forced you to change the configuration file and reboot.

Once again, Except replaces the cherry bombs that are displayed when exceptions occur with nice friendly dialog box. It is also configurable meaning you can have the program respond to some exceptions but not others.

In article <7950@trev.dsir.govt.nz> SRPDSDJ@trev.dsir.govt.nz writes:
>
>What I want to know specifically is the following.
>1) is a 520st powerful enough to run MIDI software. If not recommendations.
>2) can a non-atari hard disk be installed on an atari. How and which ones.
>3) " " " monitor " " " " " " " "

Most good MIDI software requires at leas 1 Meg RAM to RUN properly, but
you can use simple sequencers with 512 k RAM. I'm a pro-level user, and
I sometimes run out of RAM with 4 Megs...
Get a RAM-extension for your 520...

I have connected two Seagate 85Mb drives to my ST using ICD SCSI-interface.
The drive itself can be *almost* everything, but you must have a proper inter-
face to connect it. There are good drives for ST, for example Supra Drive and
ICD F.A.S.T.
If you are a novice in electronics, buy a ready, plug-and-play type drive,
but if you know what you are doing, get yourself a DMA-SCSI interface, SCSI-
controller (if the drive does not have one, like Seagate N-serie) and a
harddisk, and make your own system.

Non-Atari monitor is no problem. Most color-monitors you can connect to
Atari if you get a SCART-cable for it (the connector in ST is a weird one).
Multisync is also possible, but you must have a special switchbox or cable
to do that, and almost every model needs one a type of it's own.
I am using a Nec Multisync 3D, I really like it. All three resolutions with
same monitor. And the picture is excellent. I got a switchbox for it from
Germany (multisync+ST is a quite common combination there...)
Almost every monitor is usable with ST, as far as you can get a cable.
It is quite easy to make one if you got pin-assignments for the connectors.

>4) Can this IBM clone uudecode, unarc, zoo extract etc, files from
> comp.binaries.atari.st and then save them in a format that the atari
> would then be able to read (I have a 3.5" floppy drive). If not are there
> any work arounds.

You can directly read PC-formatted 3.5"DD-floppies with your ST, and
you PC should be able to read floppies formatted by ST. If you have TOS
version 1.4 or higher, both are possible. If not, only first one is possible.
About extracting in PC, haven't tried, but I think it should work.

>5) I have only recently begun reading this newsgroup, if there is a

I use the program Sci-Plot, which is from the Nov 1988 issue of STart mag.
It is quite nice. You could probably buy it as a back issue, or perhaps
from someone on the net (I often see STart w/disks for sale here).

>
>Nate Stelton, etan@tellabs.com

Get a copy of Vkiller 3.whatever and check your disks. I'll bet you a buck
that you have a virus, probably the Signum virus. It does nothing, but will
make a disk unreadable by a PC. I personally use ps2form to format disks
to work on both machines. I do it every day, and have never had a problem.
The virus thing drove me nuts, I would format a disk on the PC, put files
on it, take it home and just look at it (no writes), and it would no longer
work in the PC's. I tried about 15 formatters before it occured to me that
a virus might be the culprit!

596. codekeys

Newsgroup: comp.sys.atari.st
Date: 1991-01-21 07:14:42 UTC
From: Bryan_Jones_Woodworth@cup.portal.com
Message-ID: <38299@cup.portal.com>
Source record: 235503

I do believe that macro can be done with CodeKeys.. as long as the computer does not physically reboot...

You can time or NOT time macros.. CodeKeys works very good. If you time it, you can simply let codekeys "watch" what you do, and it will later execute the commands in exact order.. It will even wait 5 minutes if you wait 5 mins. If you decide later you want the delay to be less, you can go in and edit it..

This is a very powerful program.. I have no complaints.

Bryan_Jones_Woodworth@cup.portal.com

Oh yes, I do advocate Steven Grimm's attempt! We would get one reliable
LHarc running on a variety of machines.
Of course I shall support this LHarc by my Arcgsh, the graphical shell for
archiver programs for Atari ST.

>... Let's encourage Atari to give us something useful, like say one
>big master-ROM-patch that would be updated frequently and contain all
>the patches that all versions of the ROMs need.

Absolutely! I have said this all along. Patches could be issued as a bunch
of modules that say in their header what ROM version they are for and what
it patches. At boot time the master patch program just looks in the files in
the PATCH folder, or in a big file with them all in it, and does it's thing.
Patches would be posted _regularly_ and we'd all be riding on soft fluffy
clouds forever! Unfortunately we are talking about Atari here and clouds with
fuji logos are rarely this soft. :-(

FR> MfG/Regards

I have not yet tried these, as I understood that initex would not run on a 1MB machine. Now I haven't looked into it but I think it should be possible to adapt the parameters such that initex would also run on a 1MB machine. Namely by making MEMMAX smaller on initex. Initex dumps only the memory up to MEMTOP. The MEMTOP in initex and virtex should be the same, but MEMMAX may be different. Would you mind trying to get initex smaller?

Thanks a lot.

>Claus Brod can enlighten us on this...

Please don't talk of 'poolfix 4'. Its correct name is 'PFIX_CB.PRG'
due to an arrangement with Allan Pratt, the original author.

To be fair, Poolfix3 followed the XBRA standard, yet only half-heartedly.
I improved on that, and the result is that you can put it anywhere in
your AUTO folder you like.

There were no other crucial improvements except some code crunching.
I didn't delve too deep into the code in order to make sure that I did
not introduce errors due to overhasted optimization.

From: maf4003@sigma.tamu.edu
Message-ID: <11386@helios.TAMU.EDU>
Source record: 235508

(my apologies if this message has appeared before - I've had probs w/ usenet)

I would like to thank all of the people who responded to my inquiries
about the text editor accessory. I have not had time to do any ftp-ing but the
info that you have given will help me wade through the cryptic filenames.
Don, I hope that you do not think that I was ragging SpiritED because
that was not my intention. It looks as if your program I exactly what I need
from what little I was able to see. More than likely, the problem was caused
by too many accessories and auto progs (I was loading everything I have...not
too smart). Anyway, I'll do some experimenting with different configurations
and let you know how it goes as soon as possible.
Once again, thanks to all of you for your help. You and this group add
immeasurably to the value of the ST.

Thanks...
Michael Fitch

> stuck a couple of times.
>
> 1. There is a room filled with teleports which I have tried every
> possible permutation to get through and can't.

There is a way to get through. My notes are all at home, and I can't give you the exact N-S-E-W sequence, but this is how my son & I mapped out the room:

Save the game, because your people will die of hunger before you get the room completely mapped out, unless you're lucky.

Put the compass in somebody's hand, so you can always see it.

The teleports are arranged in a checkerboard pattern all over the room.

Standing at square 1, face north. Drop something, and note on the map what it was that you dropped. This will be the "landmark" that identifies square 1. Move any direction. (I'd suggest that you always move "north", until you find yourself running around in circles, or until you run out of unexplored areas of the room.) Call the next place you land, square 2. Drop something else there. BEFORE YOU MOVE AGAIN, turn around in a complete circle, and see if you can identify any landmarks or features in the room.

Repeat this procedure until you have the whole room mapped out. In the end, you will find that a sequence like N-S-E-W-N-S-S (or something) deposits you in another chamber at the SW corner of the room.

Note that a number of the teleports are "short cuts" back to square 1. This can be frustrating when you're trying to map the room, but a blessing when you've got flying snakes on your tail.

> 2. There is a room with many pits which appear and dissappear. I got
> myself into the chamber on the top right corner of the room but there
> appears to be another chamber on the top left. How do I get to it ?

Same way. I always put Leyla in my team. If I get stuck like you did, I just climb down her rope, walk through the teleporter and try again.

> 3. There is a small room with a portculis door at the other end over to
> the right. The door is opened buy a green button round the corner and
> you stand on a pressure pad as well. To get to the button you go

> what used to be a teleport and press the button. The teleport is now
> back in position so you cant go through it and soon as you step off

> the pad the door shuts again. Help !!!!!

You're not doing anything wring. You just need a little more help with your
timing (I think). Try running backwards instead of turning and running.
I don't remember how we solved this puzzle. I'll ask my son tonight.

> Thanks for the rock monster advice. I'm geting the hang of it now
> although I feel the use of fireballs is cheating since ive not been
> given a fireball scroll yet !

My son and his best friend discovered a bunch of spells just by chanting
syllables at random. If you pretend that that's what you did, then you
can sooth your conscience a little.

>-kevin

STalker's settings get saved in a file called STALKER.INF in the root directory of your boot drive (more technically, STalker looks for this file in the 'current' GEMDOS directory when it is booted, which for an ACC is A:\ or C:\). It must still be there, otherwise STalker would have reverted to the 'factory' defaults. Perhaps something during or after the Tuneup made the file hidden?

Eric

What is your numbering algoritm? How do we compare TOS versions?
The number $102 implies a number seq. 1.0, 1.2, 1.4, 1.6, ..., 1.10, 1.12 -
doesn't it?
But the actual numbering is ..., 1.6, 1.62, ($106, $162), what is to be
expected next?

Well in regards to my Request for info on sequencers, I got several recommendations for Notator, plus some good words on Cubase and Alchemie. Thanks to all who replied via email.

In regards to my things for sale, it looks like the Prospero stuff is all sold. I got 7 (!) responses for the complete set; I sent mail to all responders, but a few of my replies bounced. Its good to see a healthy demand for this stuff, as Prospero has been actively supporting this stuff for years.

While watching CNN's coverage of the Gulf War Saturday Night, I was suprised to see a commercial for a dex FAX machine (Fujitsu). The idea was that some musician had to get a manuscript (I think) to somebody else. They both had these fax machines. The musician was shown next to a computer which was an ST. The monitor was clearly an SM124 and it looks like the machine was either a 520/1040/STe but it was difficult to tell. Did anyone else see this?

> >signature changes. I don't but it doesn't look as flexible as it
> >should (any comments out there?).

I have had no problem with them. There are various gotchas alluded to in the manula, but in my opinion, they are obvious, and the manual gives them far too much attention, making it look like they are difficult to deal with when in fact it is trivial. The problems have do do with offsets in the arrange list, and if you're doing notation, you probably aren't using arrange mode anyhow.

> Have you guys ever heard of Cubase 2.0 by Steinberg Software? It also
> has notation capabilities up to the level of professional use.
> It is also cheaper than Notator, at least here.

I think it is slightly cheaper here too, but not so you'd notice.

When I was asking about notation software before, someone (probably you) mentioned Cubase, as did a guy at Manny's, but he didn't know much about it. Can you tell us more about it? Comparison with Notator would be especially appreciated. I've never seen a review of Cubase, just the ads, which don't seem to be overly hyped (hence don't make it look so impressive :-)

GFA Basic 3.0 has a command called every, with the syntax:

EVERY ticks GOSUB proc

ticks are in 1/200 of a second, so:

EVERY 200 GOSUB move_char

Every 200 ticks (1 sec) the procedure move_char is executed.

EVERY STOP stops the command and EVERY CONT continues.

Just an update on the sale:

Atari 520ST with 1MB of ram and on-board RF modulator,
includes mouse, free Word Perfect and a 1200 baud modem. SOLD

Spectre GCR with 128k Roms : Macintosh emulator SOLD

Atari Monochrome monitor SOLD

Atari SF314 SOLD

Items still forsale:

Indus GTS100 720K floppy disk drives $75

Atari Megafile 30 : 30 MB hard drive $350
Lowered price!

If you sent or called in an offer on the GTS100 please
resend it because I accidently deleted them. Sorry!

All items are in excellent condition and include
original boxes, cables, documentation and disks.
Prices do not include shipping.
All prices are negotiable, best offer gets them.

Thanks,

In a recent issue of Current Notes (I think it was November 1990), there
was a comment that PFIX_CB.PRG is self-defeating, since it allows other
autoprograms to run (and therefore allocate memory) before the memory
pool bug fix is patched in. This sounds plausible to me but I am not familiar
with the details of the bug and the what the poolfix program(s) do. I'd like to
hear comments from Claus Brod and Allan Pratt about this.

This is a summary of a solution to installing a printer on an
Atari ST. See below for e-mail response and initial problem.

Many thanks to a quick and concise response.

In article <20599@yunexus.YorkU.CA> you write:
|> Hello.
|>
|> I have an Atari ST 520 and a Panasonic 1080 (80 Column printer)
|> I am trying to get this working for a friend.
|> My experience with Atari's is very little.
|>
|> When I try to print the screen to the printer, the computer seems
|> to think that the printer is a 132-column printer and does not
|> start printing at the left margin. Also a program called StoryWriter
|> similarly starts printing at about the center of the page.
|>
|> With programs that allow you to install a printer driver, no problems
|> arise. The manual for the computer mentions a desk accessory called
|> InstallPrinter which is not available to me.
|>
|> If anyone has any suggestions (HELP) or ftp sites where I can
|> download some appropriate software, please e-mail me.
|>
|> Frank Pikelner
|> York University
|> frank@cs.yorku.ca

The problem is that the atari is assuming you have a printer (at atari
printer) that spits out something like 1280 dots per horizontal scan.
The Panasonic 1080 spits out something like 960. (Hence you are seeing
only 960/1280'th of a screen with a screen dump). There are a couple of
ways to correct this, the easiest of which is to use one of the desk
accessories that comes with the system (I forget which, could be
Install Printer that you mention not having -- I could email you
a copy if you can't find one elsewhere). At any rate, you use this
accessory to change the number of horizontal dots to 960, and then
save the desktop to all of the disks that are used to boot the system.
The printer info. is kept in the desktop.inf file and read in at boot time.

620. Problem was NOT with TUNEUP

Newsgroup: comp.sys.atari.st
Date: 1991-01-21 23:44:26 UTC
From: ramsiri@blake.u.washington.edu
Message-ID: <14854@milton.u.washington.edu>
Source record: 235526

The other day, i posted an article about using TUNEUP and then
finding problems with STlaker/STeno configuration files.

Well.. i wasn't looking in the right place for STalker.inf.
While the manual says that the .inf file will be saved
to the root directory of the boot disk, it was in fact being
save to C:\NEO\NEODESK\STalker.inf. So, while i was placing
STalker.inf on the C:\ drive, and thinking my configurations were
being saved to C:\STALKER.inf, it never ocurred to me to look
several folders deep into NEODESK.

So, there was NO problem with TUNEUP! As a matter of fact, i am
confident I will be able to use TUNEUP without risk to my data.
It was nice to see TUNEUP tune my C:\
in about 45 seconds.

621. Re: Specter GCR and 68000 accelerators

Newsgroup: comp.sys.atari.st
Date: 1991-01-21 23:44:27 UTC
From: dsmall@well.sf.ca.us
Message-ID: <22793@well.sf.ca.us>
Source record: 235527

(the thread asks of 68000 accelerators are compatible with Spectre GCR).

Yes, all of them are. The 68030 accelerators and TT are compatible with it starting with Spectre version 3.0, shipping approximately now, only; previous versions didn't handle the TT's quirks (which we didn't know about till we got one).

To cheer you up, we recently benchmarked a lab version of Spectre 3.1 (don't ask about release date, we just got out 3.0!). It was running on a 32 Mhz 68030 processor, 8 megs of available RAM. The benchmarker was Speedometer, which seems like an okay benchmarker to me.

The results were that we definitely came out ahead of the Mac IIci, which is Apple's #2 speed Mac machine. Now, only the IIfx is faster than the SST & GCR combo.

Hmmmmm. Wonder what happens if we plug in a 50 Mhz 68030 and oscillator into the SST accelerator. (*chuckle*).

Of course, Apple *always* has its Cray to win any speed contests. But I can tell you who is going to cost more in the wallet-tug factor.

-- thanks, Dave / Gadgets

p.s. Tested accelerators: CMI, Turbo-16 from FastTech, ADSpeed, HyperCache.

622. Re: how about an upgrade to 68010

Newsgroup: comp.sys.atari.st
Date: 1991-01-21 23:54:57 UTC
From: dsmall@well.sf.ca.us
Message-ID: <22795@well.sf.ca.us>
Source record: 235528

Howard's question concerns installing the 68010 CPU into an Atari.

First, the 68010 is the same sized chip as the 68000. Thus it plugs
in. That's the only easy part.

You'll need to build an adaptor board with 256K-size ROM sockets (2)
on it, mapped with an address decoder to $e0 0000. (I've gotten in the habit
of splitting up big hex numbers that way). You'll then need to get TOS 1.6 or
1.62 (I have not worked with 1.62), find every hardware access to the STE
stuff, and NOP it out. You'll have to burn that into EPROMS and somehow
connect the adaptor board to the Atari; we did it through the Mega slot.

TOS 1.6 just won't fit in the old TOS ROM sockets. Two reasons: It's
64K too big, and it is relocated from the original $fc 0000 TOS address to the
new $e0 0000 TOS address, so the first hard coded jump would crash.

THEN, you need to make sure that $e0 001a (if I remember right) is
presented to the bus on RESET so the CPU knows where to power up to. I think
you can do that by connecting a pin of the old TOS ROM socket that would
select
at RESET to the address decoder, but you're getting out of where I feel
comfortable.

After all this, you'll experience an extremely mild speed increase,
and have a little bit of all that's needed for VM and MMU mapping available;
the 68010 required external chips to do it, which you'd have to wire on.

My personal feeling is the project is worthwhile only if it would be
fun to do for the learning experience and challenge. It took us some time to
pull it off.

Also, Quick-Index doesn't run on the 68010. Tisk, tisk, tisk.

-- thanks, Dave / Gadgets

623. Re: Spectre 128 Manual

Newsgroup: comp.sys.atari.st
Date: 1991-01-22 00:01:51 UTC
From: dsmall@well.sf.ca.us
Message-ID: <22796@well.sf.ca.us>
Source record: 235529

(thread asks for a copy of the Spectre 128 manual).

Bill, I have a box of those sitting around here. Give us a buzz and we'll wing you an original on the way. Also, you want to get on our registration list (which you can do by calling) by transferring the registration; that way you can get up to Spectre 3.0, which has many, many new features you really want. (trust me). Cost of the manual will be free.

-- thanks, Dave / Gadgets

624. Re: Spectre and TOS simultaneously

Newsgroup: comp.sys.atari.st
Date: 1991-01-22 00:09:56 UTC
From: dsmall@well.sf.ca.us
Message-ID: <22797@well.sf.ca.us>
Source record: 235530

(the thread discusses SOFTLINK, Spectre, and basically running Spectre and TOS
at the same time).

I'm not that familiar with SOFTLINK or what it does.

The Spectre and TOS have entirely different memory maps, and many things
would have to be pretty cleverly handled to get them to switch between
modes (say, on a keypress). For instance, the video shifter is pointed to
another place, all the interrupts are reprogrammed, the interrupt vector base
for the MFP is moved, and so forth.

We've speculated on whether or not REVOLVER would be able to do this.
In a conversation with its authors, we think it is possible.

I personally think such a program would have to have one memory
partition active, starting at 0 (interrupt vector area), for the size of the
partition, and the others idle, since none of the low-level critical globals
of either the Mac or GEM/TOS would be available. It could do a block-copy
bankswitch and start running.

There would be all sorts of interesting things to resolve doing this,
but I think it's technically possiblr.

With the 68030's onboard MMU, life gets real easy real fast doing this.
With MMU, each partition would think it has its own machine, starting at 0;
the MMU worries about translating what the program thinks into reality.
Hence we could have multiple TOS's and even multu^[ple Spectre's running in
place,
provided there's enough memory to hold them. Oddly enough, we added
the capability of a 12 megabyte ST to our SST board, and this was one
reason why -- the ability to instantly flip from TOS to SuperCharger to
Mac mode is pretty impressive to people.

Anyway, it's possible, it's FAR easier and more reliabile with a 68030
or other MMU, and we just might add it into a future Spectre for fun.

625. german CLIPBOARD ST/TT

Newsgroup: comp.sys.atari.st
Date: 1991-01-22 00:16:14 UTC
From: ramsiri@blake.u.washington.edu
Message-ID: <14858@milton.u.washington.edu>
Source record: 235531

I have had this German CLIPBOARD acc for a long time..
all the menus are in German.. but it is obvious that
the acc handles a lot of file formats.

Questions:

1. Is there an English version.
2. I assume the program is in use in Europe, which programs can
have "clip" options that can take advantage of the acc?
3. Shouldn't the CLIPBOARD be a feature of the TT desktop?
so as to encourage its use? When i run mac software with GCR,
seems like I use this feature quite a bit.

-kevin
ramsiri@blake.acs.washington.edu

626. Re: TT questions

Newsgroup: comp.sys.atari.st
Date: 1991-01-22 00:20:01 UTC
From: dsmall@well.sf.ca.us
Message-ID: <22798@well.sf.ca.us>
Source record: 235532

The thread asks TT questions.

The TT can have up to 4 megabytes of "ST RAM". This is RAM that has
video contention; e.g., the processor can't get to it whenever it would like
to,
because the video chips are tied up displaying the picture. It's a lot like
ST RAM and runs programs in it, and so forth.

The TT can also have fastRAM, or "TT RAM". It's on a daughterboard
which I recently learned is an option you need to ask for; it's not standard.
Anyway, that has either 4 megs or 16 megs of RAM on it, depending on which
size SIMM you choose, 1 meg or 4 meg. All this RAM (ST/TT) is SIMM mounted and
dynamic RAM; I am not aware of any static RAM in the system.

For completeness' sake, there is a chip with around 60 bytes of
battery-backed up RAM in there somewhere; I know almost nothing about it.

TT RAM is burst mode (if you buy the right sorta SIMMS), 32-bit,
very quick RAM that is not slowed down by video. (My benchmarks show a 2-3X
improvement -- video takes a BIG chunk out of the TT's ST-RAM bandwidth).
Programs loaded into TTRAM, by setting the program-flag to do so, really
scream
along much faster; the flag lets you selectively load programs into the RAM
they
will work in, as some programs will break in TT-RAM. (TT-RAM cannot display
video or
do ACSI disk I/O directly to it, although buffering through ST-RAM is easy
enough.)

The TT is apparently shipping with 720K drives. According to another
network, Atari tested out prototypes of a new chip that was supposed to run\
at the higher density, but it was flaky, so they went to 720K. Also
according to elsewhere, there is a jumper if they ever get it working to
supply the new chip the higher clock rate. I would be very surprised if the
DreamPark board to do highest density drives wouldn't work in TT, though.

I read that TT currently has only FCC Class A that we all know from
Stacy, so you may have trouble getting one *at all* unless you are
a non-residential application. I am not going to suggest you tell the dealer
that you work downtown in an industrial area and are going to put your TT
next to your arc welder, all in a fully metal-shielded Faraday cage room.

My guess would be you will have a tough time getting a "custom" TT.
The configurations I saw with dealer pricing all had hard disks, for
instance.

Good luck, and I hope the information helps. Feel free to ask if
I can tell you anything more that'll help.

629. 68030 SST Specs? What to do?

Newsgroup: comp.sys.atari.st
Date: 1991-01-22 00:41:44 UTC
From: dsmall@well.sf.ca.us
Message-ID: <22799@well.sf.ca.us>
Source record: 235535

I logged into the Well here and had the, errr, "experience" of finding 84 mailed messages to me, quite a few of them asking questions about the Gadgets 68030 SST board. (Details of that board have appeared on the GEnie and Compuserve networks, and are starting to get into paper press as well).

This leaves me with a dilemma. I'm not that good at email; about 50% of my replies bounce, which is really frustrating. (Maybe I need an exorcist?) But the questions are all pretty much answered by the 68030 spec sheet, which explains what it is and why it's what way.

However, I'm told it's tacky to post such things to the net as it's considered commercial advertising. In this case it's sheer self defense, but still, I don't want to hack people off.

One way to handle it would be posted a condensed, quick spec sheet (a suggestion from a netperson more experienced than I), with some place that *interested* people can get more information, preferably FTP. Seeing as how I don't know *anything* about FTP (my UNIX box doesn't even have the software), that's a little hard for me.

So, how's about this.

The Gadgets 68030 board replaced the 68000 in the ST. It comes with a TOS compatible with the 68030, which means 1.6 or above. It has onboard 8 sockets for 1-megabyte SIMMs, which may be mapped to any address you want with the 68030's onboard MMU. They default to being mapped at the same place as the TT's fastRAM, which will help compatibility with TT-only programs.

The board is announced with 16 and 33 Mhz versions, and with SIMMs, but we encourage you to get your own RAM because it will cost you less.

The board currently only fits in a Mega or an ST "with no lid", because that's where we started; 520 and 1040 specific versions are definitely in the works.

Benchmarks indicate the board easily outruns the Mac IIci in Spectre mode, Apple's #2 machine in speed. We see no incompatibilities in Spectre mode.
In ST mode, we see around 20-30% incompatibility, but see a way of fixing a large
majority of those that I'm working on now.

The basic 68030 is available under $800, but there's a variety of options I don't want to get into on the net. (I am trying to keep this short).

In general, we feel the burst-mode fastRAM ends up being *faster* than "cache RAM" systems, such as the 68030 board from the HyperCache people in Germany. I am not hardware literate enough at that level to understand the cycle timing, but the designers has worked it out and feels sure.

The SST will allow you to have a 12 megabyte ST with a very fast CPU; your present memory is fully usable.

More info can be had from:

Gadgets by Small / 40 W. Littleton Blvd, #210-211, Littleton,CO 80120.
Phone: (303) 791-6098, M-W-Friday, FAX (303) 791-0253 24 hrs anytime.

We've already shown the board (last fall at WAACE) and it's not vapor. We expect to start mass shipping in 1st quarter, and that's a "real" 1st quarter, not an "Atari" 1st quarter.

I hope this note, which is among my briefer ones on the net (I guess I got in this habit when I was paid by the word by magazines, *grin*), will be an acceptable compromise between a very long (15K?) announcement and me pulling my hair out trying to answer the netmail enquiries. Spectre GCR owners have already received a newsletter announcing the 68030 SST, MegaTalk, and Spectre 3.0, and so the news of the SST is out anyway.

Thanks for being tolerant,

Dave / Gadgets by Small

Use ARC 6.02 ! ARC has a facility to handle scripts that tell it which files
to use. Theses scripts can be as long as you like. BTW, I do my backups
this way and never have had any problems.

Any troubles, mail me.

Hope this helps,

Funny you should say that as Atari people on Genie refer to it as
PoolFix 4, and in the GenieLamp Mag...that is why I called it that..
I did know that there were some problems when it first came out, but as
Atari people were calling it PoolFix 4, I thought that it had been put
to rest, I am sorry if it has cause a problem...

634. Re: Prob with TeX 3.1/Metafont 2.7 for ATARI ST

Newsgroup: comp.sys.atari.st
Date: 1991-01-22 02:51:50 UTC
From: tony@tacky.cs.olemiss.edu
Message-ID: <1991Jan22.025150.902@cs.olemiss.edu>
Source record: 235540

I downloaded all the .lzh files from the terminator archive.

I de-lzhed em all, putting together what seemed like a reasonable
directory tree for the files, given the README file included with
TeX and Metafont.

Various attempts at running TeX with the Mark William's Shell <msh>,
PCOMMAND, etc. reduced my elation at having TeX on my 1040 to maddness
at myself for bothering to download.

It seems the only way I can run TeX is to turn off my hard-drive and
run it from my floppy. I even reduced my FOLDRXXX to about 10 extra
folders and took out all my accessories and it still would only run
from the desktop. Of course I can't set the environment from the
desktop, so that is a non-solution.

By the way, my setup is as follows:
TOS 1.0, 1040 1MB, SH204 running HDX3.01, and various AUTO
folder programs enabled or disabled at any given time.

Is it just me or do I have an <obsolete |:) > 1040ST?

How about an earlier version of TeX, with a listing of the files
one needs to grab in order to get a working setup?

PLEASE! HELP! I've had a hardcover TeXbook for 3 years and want
to use it!
!!
Please note! All mail directed to me should be sent to my new address:

[stuff deleted]

I have a friend, who uses Ultrascript, and has a very high opinion of it.
He is professionally involved in graphical design and uses Ultrscipt at
home. The PS files are produced by Xpress and Pagemaker (using Spectre on
the Atari) and printed using Ultrscript. It requires at least 2 Mb of
ST memory. The printer he uses is a HP Deskjet, which gives near laser
quality. I know for sure that NEC 24 needle matrix printers are supported,
and probably also Epsons.

PS The White Lord will not recognize this firestaff as being the firestaff...
I guess FTL didn't think that you could get out with it!

643. SIMM upgrades for STe

Newsgroup: comp.sys.atari.st
Date: 1991-01-22 15:25:57 UTC
From: csuab@warwick.ac.uk
Message-ID: <1991Jan22.152557.22796@warwick.ac.uk>
Source record: 235550

Hi,

I've got a 2 meg STe at the moment, and I'm thinking about upgrading it to 4 meg. I'm also toying with the idea of buying a TT in about a years time. I have heard that a TT has two types of RAM - ST RAM and TT RAM. My guess is that the TT RAM is faster than the ST RAM. The question is - can I buy the faster RAM (if that is the difference) and put it in my STe, so that when (if) I get the TT, I can the new SIMMS out of the STe and put them straight into the TT. If anyone can help with this, I would be most gratefull. Also, if anyone out there has a TT, could they mail me some comments on the machine - mainly, how compatible is it with ST software?

Thanks alot

Steve

> In article <14597@milton.u.washington.edu> ramsiri@blake.u.washington.edu asks:
> => Are pinhead and FATSPEED incompatible/unnecessary? with 1.4?
>
1.
FATSPEED was a neat upgrade for TOS 1.2 to get around the SLOW down on HD as they filled up. (Yes and other improvements as well).

TOS 1.4 has fixed this, and added a good working cache.

2.
pinhead allows you to take advantage of a new feature in TOS 1.4; namely whether to ZERO the Bss or not.

Like MS/DOS TOS normally clears ALL unused memory that is initially assigned to a process. On multi-meg processors this is somewhat slow. (Again TOS 1.4 uses better code and does clear faster.). There is a new bit in the process header that indicates that TOS need not clear bss, as the process will do its own initialization.

3.
Also a note on poolfix3 and poolfix4.
poolfix3 is the OFICIAL, ATARI program, freely distributed to the net.
It allows increasing the caches in TOS 1.4.

We (on the net) tried to suppress the name poolfix4, but I see it raised again.
This was a reverse engineered version from Germany that set out to add their protocol for TSR programs; but was also substantially improved (Authors words) which means that it is not supported or blessed by Atari.

I have not seen any comment as to failures with "poolfix4" so it may well be safe.

To Summarize:
Dont use FATSPEED with TOS1.4
Pinhead will speed loading programs if they do not require initialized BSS.
Use Poolfix3 or whatever to improve the performance of the internal caches in TOS 1.4.

There are other sources.
1. Berkely Micro Systems sells CT backup and software.
2. My own BACKUP program works well for me on the Adaptec 3530 SCSI controller.
3. Theres another fellow posting recently on his own driver.

So go ahead, put a system together. The mechanics of driving a CT is not
all that difficult. And there is software.

648. Atari for sale

Newsgroup: comp.sys.atari.st
Date: 1991-01-22 16:11:50 UTC
From: fer9483@tesla.njit.edu
Message-ID: <1106@tesla.njit.edu>
Source record: 235405

I have the following for sale:

Atari 1040st with TOS 1.4 in ROM
Atari monochrome monitor
Atari color monitor
Panasonic Kx-p1090 printer

The printer is missing a tractor clip to hold the tractor feeder in place (only on one side). The printer still works fine without it, but a new one can be bought for like $3.00. Everything else is in perfect working condition.

I also have the following software:

Tacklebox St (Personal Pascal routines to AES/VDI/TOS/GEM)
WordUp! 3.0

I need to get rid of this fast, so I will sell cheap. Call me and make an offer. My number is 908-276-9667. If I am not there leave me a message and I will get back to you.

-Frank Rachel

649. GNU diff and diff3

Newsgroup: comp.sys.atari.st
Date: 1991-01-22 16:29:24 UTC
From: piet@cs.ruu.nl
Message-ID: <4708@ruuinf.cs.ruu.nl>
Source record: 235406

I have ported the new versions (1.15) of GNU diff and diff3 to TOS. I consider this to be a beta version and I am willing to distribute it to people who want to use it seriously and are willing to report on problems encountered. I don't want to distribute it NOW to persons that just collect software.

After a few weeks of testing I will make it available to the general public. If you are interested in beta testing, drop me a note. Take care that I get a valid return address. I will provide the binaries and the standard README file in a ZOO archive. There is as yet no decent manual.

650. DM 1: Help on level 6

Newsgroup: comp.sys.atari.st
Date: 1991-01-22 16:51:41 UTC
From: gh@geovision.uucp
Message-ID: <1346@geovision.UUCP>
Source record: 235407
Cross-posted to: comp.sys.amiga.games,comp.sys.atari.st

I need help on level 6(?) of DM (the first floor where you encounter those big floating round monsters with the big eyeball). I'm trying to get a key that is in a room behind a gate. I need the key to open the second of two doors at the other end of the hallway. I can't figure out how to keep the gate open so that I can get the key. The room has three pressure pads on the floor, a pit, a green button on the wall, and a lever which turns a block of blue (teleportation) haze on and off. The room looks like this:

```
__ [] - Pressure pad
__ | k| <> - Pit
|[]B__|==| == - Gate
|<> ## L ## - Blue haze
|[] [] | B - location of green button
| +-----+ L - location of lever
|--| k - location of key that I need.
| |
```

No matter what combination of movements, lever settings, etc. I try, I can't seem to stop the gate from closing when I walk on the bottom-center pressure pad (and I can't see anyway of getting around walking on it). I need the key for the second of two doors at the other end of the hallway (I already had a key for the first door).

Thanks for any help.

George

>win, and for me, at least, a relatively large benefit.

really? ok... why do you think so?

>it would probably not break any existing code. if so, how?

For one thing, most file selector boxes, and command shells, translate lower case characters into uppercase before processing input lines (sometimes they even echo back uppercase, but sometimes they don't, so you find this out the hard way).
Neodesk and PCOMMAND and LGSELECT are three examples I can think of offhand. Another problem is that the people who write programs which have a call like

fp=fopen("datafile.in","r");

assume that there is a file on the disk matching this name - but when we suddenlly add case sensitivity to TOS, what happens to the files which are on disk already? will they be considered all caps (so most programs can read them after this conversion to uppercase) or all lower case (so the c programs with lines like above will work)?

It is a FACT that if such a convention were added, TONS of programs would need little changes to work again. I happen to use a few programs which are no longer being maintained by the author, and I don't have the sourcecode. What do I do now that I can't run them anymore?

> and it is a BIG win, IMHO. don't knock it 'til you've tried it.

yeah you said that already. so lets hear why you think so! All you've said is "it's great - everyone who likes unix should love it!". Well, I love unix myself, I don't see the connection. Lets hear some support for your opinions. Why is it so great to have those extra 26 characters? Well, you can have IN THE SAME VERY DIRECTORY files like

jove.RC
jovE.rC
JoVe.Rc
JOVE.RC
jove.rc

big deal.

And this is just a half-assed step towards a unix-like filesystem - if you want a real unix filesystem, you gotta throw out all this TOS and MSDOS bullshit and start FROM SCRATCH - we don't need all these tiny little steps which make everything incompatible but look a little more like unix - give me a break!

WordFlair is not a DTP program. It is a word processor in the vein of Word Up! Now as a user of Word Up!, if all you want to do is type a few papers and possibly put in a picture or two, then Word Up is fine. I don't know much about WordFlair except that they just released WordFliar II. It is much more similar to Word Up, I heard. But if you really want to DTP then there is only one answer, Calamus. I use Calamus and it is everything you need, and more. My friends that have Aldus Page maker on their Mac's come to my room to use Calamus instead of Aldus. So if STP is your thing, then go with Calamus. BTW, it does not require, but it is a good idea to have a Hard Drive. Once you start getting fonts and stuff, your space goes real fast, especially if you use UltraScript.

Hope this Helps. If you have any questions about Word Up or Calamus leave me a message.

ATARI 1040ST HARDWARE and SOFTWARE PACKAGE FOR SALE

piece-price
1040 ST with Joystick and internal $350
battery-backed-up clock
SC1224 Color Monitor $175
IB Drives external 5.25" 360K floppy drive $125
all cables, documentation and packaging included
----
total piece-price: $650
<><><>
Entire system package price: $575

If you buy the entire system, I'll toss in, at no extra charge,
commercial programs including Wordprocessing, Drawing, Games
and "Printout" software -- I'll be happy to send details on
request. In addition, I also have about 40-50 3.5" 720K Floppies,
and something like 20 5.25" 360K floppies. Some are empty, some
filled with freeware and shareware. I'll include these too if
you buy the whole system.

I also have an Okidata Microline 92 printer with the Plug-and-Play
(IBM/EPSON-compatibility) ROM package and the High-speed Serial
Port Option -- either or both can be installed or not at your
choice. I'd like $100.00 for it, but that's negotiable too.

Please don't be too shy to email your offers for all or part
to me at 'gaz@apollo.hp.com'. Everything is negotiable.

Can someone tell me where it is on comp.binaries.atari.st?

I've checked the entire binaries index to Panarthea and I've checked volumes 10 to 12 in the Binaries directory on atari.archive (which should be redundant coverage). I've found a few programs that do plotting in the binaries archive(s), however, I need the ability to generate a Postscript output file which GNU Plot sounds like it has.

On the other hand, are there programs out there that'll do a screen dump (monochrome format) to disk? (Then all I'd need to do is ask on comp.lang.postscript how to print that on a postscript printer!)

The bug in the pool code only comes up when GEMDOS needs to "compact"
the pool, and that isn't likely to happen as a result of stuff you
do in the AUTO folder.

The fix should come with a doc file describing the bug and the fix, for
people who ask questions like that. In short, the bug is in the compaction
code, and the fix is arrange the pool from outside so as to ensure that the
code with the bug never executes.

Message-ID: <1991Jan23.000615.17312@imada.dk>
Source record: 235426

Hi;

I have just "bought" a PD version of Spice, it's dated 1985 or 1986!!
(If I remember correctly it's version 2G5 and written in Fortran).

The problem is that the thing don't run from the harddisc. When Spice is run from the harddisc (after PRL.PRG) it stops with 2 bombs, and if I don't run PRL.PRG Spice instructs me to do so... Therefore I think that the problem has something to do with the PRL program, which appears to hold a resident library (It flashes a message "PRL 1.4 loaded" - or something like that on the screen).

If I boot without harddisc and start the program from disc everything works OK...

Can somebody help me, or give a pointer to a newer version?
(I use a ICD controller/software, TOS1.4, and have 2 Mb).

I will be forever gratefull for any help...

- Klaus

670. tar for the ST

671. First Word + driver p5200

Newsgroup: comp.sys.atari.st
Date: 1991-01-23 02:16:40 UTC
From: hutch@peg.UUCP
Message-ID: <937100010@peg>
Source record: 235428

I have a bit of a problem.

I use First Word Plus, and it is fine for the sort of WP'ing I do, the problem is that I can't find a printer driver for my printer.

The disk I got the program on when I bought my ST had only the basic files on it and nothing to build or configure a printer file.

I have an NEC Pinwriter, P5200 24 pin dot matrix printer. Does anyone out there have a driver for this? For First Word Plus or Publishing Partner too?

I'd be forever grateful if you would E-mail me a copy to

Internet:hutch@peg.pegasus.oz.au

Thanks in anticipation

Chris

672. Word Up 3.0 Patches

Newsgroup: comp.sys.atari.st
Date: 1991-01-23 03:32:21 UTC
From: rlcollins@miavx1.acs.muohio.edu
Message-ID: <3455.279cbd75@miavx1.acs.muohio.edu>
Source record: 235429

A friend of mine has recently acquired Word-Up 3.0, but it crashes all the time, so I think it needs the patches that were talked about awhile ago. Can anyone tell me where I can get them? (I checked GEnie, but I couldn't find them.)

Thanks,

673. Z-Keys for sale!

Newsgroup: comp.sys.atari.st
Date: 1991-01-23 03:48:16 UTC
From: chuck@umbc5.umbc.edu
Message-ID: <4877@umbc3.UMBC.EDU>
Source record: 235430

I have a brand new "Z-Keys" package for the ST. This product will allow you to use a standard IBM PC/AT keyboard on the ST while still allowing you to use the original keyboard. It does not run through the MIDI ports like some other adapters, but plugs right into the keyboard socket on the inside of the computer and has a cable that extends outside so that you can plug in the external keyboard.

I am asking $75 including shipping (COD is extra).

Chuck Rickard
(chuck@umbc5.umbc.edu)

674. Atari ST hardware/software sale

Newsgroup: comp.sys.atari.st
Date: 1991-01-23 04:31:16 UTC
From: rohde@spaghetti.cis.ohio-state.edu
Message-ID: <87536@tut.cis.ohio-state.edu>
Source record: 235431

If anyone is keeping count, I promised that my previous 'for sale' posting
was my last. Sorry, I found a mess of my old software. Let's get
on with it, and if something is priced too high, let me know. These
items have got to go, we are overstocked :-)
(The new stuff first)

Software: All manuals included

Leisure Suit Larry goes looking for $10
love in several wrong places (II I believe)

GFA Basic and Compiler $15
2.02 (let me know if this is what went PD)

Thunder Spelling Checker $10

Bards Tale $10

Sundog - Frozen Legacy $10

Habacom - Modem Program $free with anything
if you want it.
NeoDesk $10
Original - maybe you can upgrade cheap?

LDW Basic $10
Version ??? (old though)

Software - No Manuals
Karate Kid II $5
Super Huey $free, 1st grab with
other stuff.
Epyx Wrestling $5
(Well worth it, I'd ask 15 if I had the manual)
Balance of Power $5
Death Sword $5
(I'd say B.O.P. is the only one that hurts without a manual)

Books:
Compute's 1st book of Atari $free with anything
Compute's ST Programmers Guide $5
Abacus - Gem reference $8
Abacus - Internals $8
Abacus - Tricks and Tips $free with anything
Abacus - Graphics & Sound $8
Abacus - 3D Graphics $8

Please, you pay shipping on anything here since it's going cheap. Also,
I discourage sales totaling less that $30, but hey, whatever.

Any of you die hard's left? Here's the old list again, remember, prices
are not firm, but I thought they were fair (I've been wrong before though :-).

Atari 1040 ST $650
2.5 Mbytes of RAM, TOS 1.4, Double Sided drive

Atari SC1224 Color Monitor $250
Atari SM124 Monochrome Monitor $125
Both work fine

HiSoft C $45
Interpriter that can link with
object code. Nice toy or
debugging tool. Not too useful
without other C compilers.

Send mail to: rohde@cis.ohio-state.edu

Thanks for your time once again.

Joe

675. STadel -- once more from the top

Newsgroup: comp.sys.atari.st
Date: 1991-01-23 05:43:21 UTC
From: kgg@zinn.MV.COM
Message-ID: <1137@zinn.MV.COM>
Source record: 235447

I once obtained a copy of STadel, about 2 years ago.
Couldn't get it to work in the time I had, would like to try again.

I want it mostly for UUCP access to replace UUPC/ST (see address below)
because a bug therein prevents me from successfully sending mail --
I can only receive. Also, no support for news. But I already have
my feed up and working. Also, I gather it has hooks or automating
access to BIX. I no longer have a BIX account, but have or will have
accounts on other public commercial systems; does STadel support
access to other systems or that ilk? Which ones? CIS? GEnie? Delphi?

Anyway...
Where and how can I obtain the current version of STadel?
How much disk space does 'the kit' (the set of files as distributed) take,
and how much space is used by the running system?

Also, I've heard of a couple of newer variants, incl <fnord>adel???
Where and how can I obtain the current versions of those?
How much disk space does 'the kit' (the set of files as distributed) take,
and how much space is used by the running system?

Hmm, I thought since TOS 1.4 it made no difference whether the disk was
formatted on an ST or a PC. Comments anyone?

Anyway, I am able to exchange floppies formatted on my ST with my Sun
SparcStation where I read and write them with Mtools.

678. osbind.arc

Newsgroup: comp.sys.atari.st
Date: 1991-01-23 09:25:28 UTC
From: piet@cs.ruu.nl
Message-ID: <4710@ruuinf.cs.ruu.nl>
Source record: 235445

There is a file osbind.arc on atari.archive.umich.edu that is incorrect:

It contains the following lines:

```
/* codes for Pexec */

#define PE_LOADGO 0 /* load & go */
#define PE_LOAD 1 /* just load */
#define PE_CBASEPAGE 2 /* just create basepage */
#define PE_GO 3 /* just go */
```

which should be:

```
#define PE_LOADGO 0 /* load & go */
#define PE_LOAD 3 /* just load */
#define PE_CBASEPAGE 5 /* just create basepage */
#define PE_GO 4 /* just go */
```

I think this file should be removed as it is superseded by the one in
gcclib (include).

680. DM1: Some Spells...

Newsgroup: comp.sys.atari.st
Date: 1991-01-23 11:40:36 UTC
From: johnu@syma.sussex.ac.uk
Message-ID: <4288@syma.sussex.ac.uk>
Source record: 235432
Cross-posted to: rec.games.misc,comp.sys.atari.st,comp.sys.amiga.games

There are a couple of DM1 spells that I'm confused by...

Essentially there are two spells to light ones way around.

1. Ful i.e. a magic torch according to the scroll and

2. Oh ir ra which simply is light according to the scroll.

Are there useful differences between these two ?

Secondly the spell for darkness, i.e. Des ir sar: has anyone found a use
for this. I find I can be equally beaten senseless in the full light of
day or in complete darrkness. I must admit I havn't tried this
comparison with all foes but i havn't got that much time to waste !

I havn't tried invisibility yet; presumably i can sneak past things
without being attacked ?

Thanks for any help.

>>it would probably not break any existing code. if so, how?
>
>For one thing, most file selector boxes, and command shells, translate
>lower case characters into uppercase before processing input lines

i don't know about "most" but gulam does not xlate to upper case. it passes things off to exec'd processes with no case conversion. some compiler startup codes and libraries do that, but i don't thing GNU c is one of the, and i even patched good ol' alcyon to stop that foolish practice. in fact no unix shell clone on the st does this now (gulam, bash, msh, etc). PCOMMAND and NEODESK are not unix-like shells.

the desktop does, however, force upper case, which is why it is a pain in the *ss to run unix utilites from the desktop, especially ones which have different meanings of "-c" and "-C".

all this talk has nothing to do with TOS itself supporting (even toggling this feature on/off) mixed case file names.

look, i'd like to have the option of switching case sensitivity on and off at will. i myself see no reason why this cannot be added. i myself like having important files in caps (like README and Makefile) since with a directory list, they appear set aside, and easy to spot (i.e. more productive). pls don't argue that YOU may find it revolting. I do not. and besides, if it is SWITCHABLE, then it does not impact you our any program in the slightest. i have discussed how this can be done in a previous note.

all i want to do is find out CAN IT BE DONE and IS ATARI PLANNING ON DOING THIS? which apratt@atari answered.

>fp=fopen("datafile.in","r");

i can't see how/why a program has to force case anyway, since TOS does it for you. it IS case insensitive, so DaTaFiLe.In is the same file as datafile.in is the same as DATAFILE.IN is the same as DataFile.In, etc. The only reason programs force upper case is for cosmetic reasons, i.e. for consistency. try it youself:

```
#include <stdio.h>
main()
{
FILE *fp;
```

```
char buf[256];
fp=fopen("datafile.in","w");
fprintf(fp,"Hello\n");
fclose(fp);
fp=fopen("DATAFILE.IN","r");
fscanf(fp,"%s",buf);
printf("%s\n",buf);
fclose(fp);
exit(0);
}
```

i bet this will print "Hello". meaning it does not matter AT ALL what
case the file name is. both fopens open the same file.

i already mentioned that the program can make a call like this to force
old, compatible behavior:

```
Fcase(CASE_OFF);
```

BEFORE doing anything, if it must. and i already mentioned that the
desktop of TOS x.x which would have this new feature can have an
additional menu item for configuration (which would cause Fcase
be called if the menu state changes, just like the blitter). FOr those
of you who still don't understand this, i offer this hypothetical desktop
menu (for those who hate cmd shells):

```
_______________________________________
| Configure |
|---------------------|
. .
. .
|---------------------|
| X Case sensitivity |
|---------------------|
. ^ .
. | .
"X" means it is ENabled...

_______________________________________
| Configure |
|---------------------|
. .
. .
|---------------------|
| Case sensitivity |
|---------------------|
. ^ .
. | .
no "X" means it is DISabled...
```

>It is a FACT that if such a convention were added, TONS of programs
>would need little changes to work again. I happen to use a few programs

see above. it does NOT effect the programs, if implemented this way. and
new programs can inquire the state of case sensitivity:

state = Fcase (CASE_INQUIRE);

or somesuch.

here is the example program with this "new" TOS:

```
#include <stdio.h>
main()
{
FILE *fp;
char buf[256];
if(Fcase(CASE_INQURE) == CASE_ON) Fcase(CASE_OFF); /* added...*/
fp=fopen("datafile.in","w");
fprintf(fp,"Hello\n");
fclose(fp);
fp=fopen("DATAFILE.IN","r");
fscanf(fp,"%s",buf);
printf("%s\n",buf);
fclose(fp);
exit(0);
}
```

for existing programs, the

```
if(Fcase(CASE_INQURE) == CASE_ON) Fcase(CASE_OFF); /* added...*/
```

is done with the desktop menu selection, making it 10000000% compatible with
older TOS.

how can i make this any clearer?

if the effort to do this is 2 manweeks (design, implement, debug, test,
document), and it takes 50 bytes of ROM, WHY NOT DO IT????? sheesh!

>which are no longer being maintained by the author, and I don't have the
>sourcecode. What do I do now that I can't run them anymore?
>
>> and it is a BIG win, IMHO. don't knock it 'til you've tried it.

i prefer seeing files in my directory like this:

```
% ls
Makefile bbb.c eee.c nnn.c
README ccc.c hhh.c ppp.c
aaa.c ddd.c iii.c sss.c
```

over:

```
% ls
aaa.c ddd.c iii.c ppp.c
bbb.c eee.c makefile readme
ccc.c hhh.c nnn.c sss.c
```

since my eye is trained to go to the upper left on a page first, so
"important" files should be there (and i keep them there, consciously).
Yes, this is unix. but it is equally valid for directories which use
icons, or file selector boxes, or whatever.

also, it is a pain in the *ss which moving mixed case file names
between systems which do have case sensitivity (e.g. unix) and the ST.
you always have to convert names.

>can have IN THE SAME VERY DIRECTORY files like
>
>jove.RC
>jovE.rC
>JoVe.Rc
>JOVE.RC
>jove.rc

not a very good example

>And this is just a half-assed step towards a unix-like filesystem - if you
>want a real unix filesystem, you gotta throw out all this TOS and MSDOS

no one is talking about a unix file system, just something that can't be
more trivial to implement, will NOT break any existing code, and certainly
can't hurt at all (and can help, at least me...). a unix FS does not make
sense (really) on the ST since it is not multitasking. note that ST/MINIX
does implement FS, but then again it is not running TOS.

all i want is a choice. right now we do not have one...

i think gulam can do:

chmod -h file

since i have my own chmod, which does do this, i don't know for sure.
there ARE advantages to command shells... :-)

note that hidden files can be viewed with:

ls -a

again, this is my own ls, gulam's may not do this...

Source record: 235453

The stuff in a previous host about process headers sounded right (I'm not a software person...) but

Pinhead is not needed with TOS 1.4, (It will work however) as TOS 1.5 uses a 'Fastload' bit in the directory to indicate whether a program needs to have memory cleared before it loads. A rather clumsy utility was available to set this bit (for faster loading... slow loading is the default! Argh!!!) but I despise clumsy utilities and am waiting for a utility that will allow selection of multiple files at a time to have the "fast bit" set.

Okay... som more questions... I need software that will backup

1) Specific file extensions from a list of partitions
(say all *.arc and *.lzh filed from drive d: and e:)

2) Backup only specific subdirectories...
(the BBS subdirectories on drives g: and h:)

3) handle incremental backups, appending them to the tape backup the incremental is incremental to... (I guess appending to the tape in the drive is what i really mean...)

4) I really would like to do IMAGE backups as the restore of a partition should be swift that way... but file backups as above are nice...

5) Can I still backup my Spectre partition w/o ICDs software????

thanks
jc

689. SM124 monichrome monitor problem...

Newsgroup: comp.sys.atari.st
Date: 1991-01-23 14:27:22 UTC
From: selick@bucsf.bu.edu
Message-ID: <72918@bu.edu.bu.edu>
Source record: 235456

I've had this SM124 monichrome monitor for about ummm...5 months and it has a lot of extra light around the used portion. Is there an adjustment for this (inside the monitor maybe?)? Help!
-steve
<selick@bucsf.bu.edu>

690. Adaptor to convert SM-124/5 to greyscale?

Newsgroup: comp.sys.atari.st

From: mike@abekrd.UUCP
Message-ID: <1653@abekrd.UUCP>
Source record: 235466

I heard rumour of an adaptor for inside the monochrome monitor to convert it into a proper greyscale display capable of showing medium and low resolutions. Needless to say it cane from Germany. I remember people saying that they had ordered one and would report the result.

Well, did anybody get one? Does it work? Where from and how much?

Andv<Thanx>ance.

From: mike@abekrd.UUCP
Message-ID: <1654@abekrd.UUCP>
Source record: 235460

An increasing number of programs require special environment variables before they will function correctly (at all). I want to be able to set-up these variables within my GEM desktop and then just execute .TTPs as required.

Do I just add lines to ASSIGN.SYS, or is life not that simple ? If that is the answer what format should the line be, is it just:

VARIABLE=value

like the path commands?

Seeking enlightenment (as always),

692. Treeview for GEM ?

Newsgroup: comp.sys.atari.st
Date: 1991-01-23 15:38:44 UTC
From: mike@abekrd.UUCP
Message-ID: <1656@abekrd.UUCP>
Source record: 235461

At a recent exhibition, I saw a TT (beautiful) running Gemini 1.2 (the share-
ware version). Under this was an accessory called Treeview which gave a
graphical view of your disk with a tree type layout. I asked about it on
the stand and they said that it was part of the Gemini 1.2 distribution and
that it required Gemini to work.

What I would like to know is: Does Treeview _really_ need Gemini to work, or
will it run under GEM? Is Treeview available from somewhere else? Is it
shareware too? It was real neat to be able to find the directory you've been
looking for, quickly and easily.

Looks like today is a "Why, mommy... why??" day ;-) (3rd post asking questions)

Source record: 235434

There is a program called TC-POWER which emulates expanded memory
in a PC which has extended memory.

I have a special version which is meant to work with Atari-ST memory
under pc-emulators such as Supercharger. I bought this from Talon
Systems for $50. I never used it, as I have no need for programs that
use so much memory.

It can be yours for $40 shipping included. That is, if you are in Canada,
$40 cdn is sufficient, and if you're in the US, $40 u.s. is fine too.

if you are interested, drop me a line.

Dear Allan,

Could you clarify for everyone the state of known bugs in TOS 1.4 and
the official patches available to fix them? I am only aware of two
official patches from Atari---poolfix3.prg and tos14fix.prg.
Unofficially, I have heard of at least six TOS 1.4 "bugs" reported in
a German magazine.

About the ICD FAsT Tape Backup system:

They use TEAC tape cassette drives. There are 60meg, 150meg, etc.
capacities available, though ICD only uses the 150meg drives.
They are now starting to become more readily available; I was
visiting Schaumburg, IL and dropped in at a Soft Warehouse store
out of curiosity. They were carrying those drives with IBM PC
controllers and software.

However, the drives sold by ICD have had their SCSI ID proms
(or whatever the appropriate term is) changed to a non-standard value.
That value is explicitly checked for by their software. As is,
their controller software will only work with drives sold by ICD.

Technical manuals for the drives are available from TEAC.

I know someone locally whose working on a third party tape backup
package using these TEAC drives, though I'm not sure how close he is
to a release (it's not a full-time effort.....)

In regards to this question, I wonder: I have been having some rather disturbing problems lately. Sometimes, especially after running Cleanup (the one from ICD, not the demo), I go to open a drive that has not been accessed prior to running Cleanup, and there is nothing there! 0 out of 0 files! Also, if I trying going any deeper into an accessed drive, the directory doesn't exist! The worst part was when I tried to run Cleanup on my drive E and it had two bombs when it went to do a directory map. However, by turning the machine off and then on, everything reappears like it should, and everything is accessible. I don't believe the fault lies in Cleanup since occaisionally the same thing happens when I do not use it - I just go into my Utilities directory, only to find all the files are gone (but soon reappear by re-booting). I currently have in my Auto folder (and not neccessarily in this order as I am not at home) Copyfix. , timeset. , pinhed18., fatspeed., and QuickST2.2 (i forgot the prog name) progs.
Just to show how frustrating this is, I just ran Cleanup on my E drive fine, but the F drive bombed (however, my C drive has been working and never bombs under Cleanup or DLII...Whew!).
Anyone have any ideas? Comments?

-Mike

700. Re: TOS Version (was Veriosn)

Newsgroup: comp.sys.atari.st
Date: 1991-01-23 18:50:06 UTC
From: apratt@atari.UUCP
Message-ID: <2813@atari.UUCP>
Source record: 235438

>apratt@atari.UUCP (Allan Pratt) writes:
>>The definite way to tell is to read the OS header. A pointer to the OS
>>header is at $4f2, and the TOS version number is found in the second
>>word of the OS header. For example, $0102 there means TOS 1.2.

And micro@imada.dk (Klaus Pedersen) writes:
>What is your numbering algoritm? How do we compare TOS versions?
>The number $102 implies a number seq. 1.0, 1.2, 1.4, 1.6, ..., 1.10, 1.12 -
>doesn't it?
>But the actual numbering is ..., 1.6, 1.62, ($106, $162), what is to be
>expected next?

When we realized that TOS 1.6 needed to be fixed, and we didn't want to mess people up too badly, we decided to call it TOS 1.62. It just sounds like a smaller change, which it is, from TOS 1.6 than calling the new one TOS 1.8.

There is no "algorithm" but it is definitely the case that within a major number (1.X, 2.X, 3.X) you can compare the minor number numerically and the greater number will be the newer version. Mega STe and TT TOS have this rule implicit in the numbering when spelled out: I always refer to "TOS 3.05" not "TOS 3.5."

ROUGHLY, the major number represents increased capability or "power" of the machine: 1.X is ST and STe, 2.X is Mega STe, and 3.X is TT. This part is not a hard-and-fast rule; it is conceivable that you could see 4.X for one machine and 5.X for another, and the 4.X could be "more powerful" by some measures. Alternatively, you could easily see 3.X in a future machine which is "more powerful" than a TT.

From: tony@tacky.cs.olemiss.edu
Message-ID: <1991Jan23.211440.5812@cs.olemiss.edu>
Source record: 235472

Okay, as long as the PC has a 1.44MB disk (haven't tried with 720K), and
the disk has had an IBM boot sector written to it, you can read/write
twister formatted disks!

You can add a line like:

drivparm=/d:1 /n:10 /t:82

This makes a new device at boot time, drive x: (x is one letter greater
than the last drive that was installed), assumes your 1.44 is drive B:
to start with, and sets the new drive up as 10 sec/track and 82 tracks/
disk.

When Mess-Doss comes up, it will say something like:

INSTALLED NEW DEVICE FOR DRIVE D:

(I just tried it with MS-DOS 3.3 and it said "Unrecognized command in
CONFIG.SYS," but I know it works with DOS 4.01)

Then you can type "dir d:" and the computer will say
"Put disk for drive D: in drive B:"
You slip it the disk, and bingo, r/w twister disks, no problems.

Note that I make no guarantees that this'll work; I had now
problems, and used it AT MY OWN RISK. Please consult your
Mess-Doss manual for information on DRIVPARM. I have not tried it
with the disks produced by FORMAT11, as my system cannot reliably r/w
these disks. Sorry.

Also note that there is NO E in DRIVPARM! It stung me three times!

!!!

704. Supercharger questions

Newsgroup: comp.sys.atari.st
Date: 1991-01-23 21:41:45 UTC
From: depeche@cs.mcgill.ca
Message-ID: <1991Jan23.214145.15305@cs.mcgill.ca>
Source record: 235476

I have Supercharger, along with the 1.4 upgrade. I have a few problems with it, and I have written a total of 4 letters asking for support to Talon technology, and NONE of them have been answered - the only time I get any response is when I call them on the phone, and they promptly try to sell me new software every time I do this. I hate calling them because my phone bill is getting so high. Any help would be appreciated.

oh yeah: don't buy from talon unless you live in Solana Beach, since it's a local call from there!!!!! (I'm getting pretty pissed off at them now)

1] Does anyone else have the problem where you hit ctrl-s to pause output and the entire computer crashes? This happens when I am viewing a directory, TYPEing a file, or running GREP, or whatever.
2] does the hotkey work when using a SM124 monitor?
3] This is to people who have the SUPRA hard drive wtih clock -

The supclkread program that came with supra utilities sends something through the DMA port which causes the data light on the supercharger to light up - and this crashes the computer as well.
With the 1.4 upgrade, there is a QUIET.PRG which prevents programs from accidentally talking to the supercharger, and this makes it possible for me to boot up my ST without holding down the RESET button on the supercharger, but it also prevents SUPCLKREAD from reading in the time from the hard disk.

Has anyone out there written a supra clock reader program which behaves properly so that I can install QUIET.PRG and still read in the proper time?

Thanks in advance !!

There are a couple of PD or Shareware desk accessories that will do this, notably Disk Manager, X Utilities, and MOBZUTIL. But, I must plug Universal Item Selector III. It will do this and more. It's well worth its price. BRE Software (800-347-6760) sells it for $10.95. Sav-On Software (800-875-SAVON) has it for $13. After just a quick look through ST Informer.

Message-ID: <3484.279e17af@miavx1.acs.muohio.edu>
Source record: 235478

Looking in the Jan 1991 issue of byte, they have an overview of Digital Research's FlexOS, a multi-user, multitasking operating system for 286/386 computers. Well, the operating system runs DOS applications, and heres the kicker, DR has ported GEM over to it, renaming it X/GEM. Current GEM applications for ms-dos work under it also.

What I was wondering is: How close has Atari been working with Digital Research over these past years? And what are the possibilities of having FlexOS and X/GEM ported over to work on the ST?

711. D.A.T. backups

Newsgroup: comp.sys.atari.st
Date: 1991-01-24 06:44:14 UTC
From: ramsiri@blake.u.washington.edu
Message-ID: <15031@milton.u.washington.edu>
Source record: 235452

I have a couple of DAT machines. I would like to use
them to back up my hard drive. Anything out there that would
let me do this? ONe machine has both analog and digital IN/OUT.
The other, analog.

Thanks,

Kevin
ramsiri@blake.acs.washington.edu

If you have a look at some public domain software and read the documentation
files and such like, you will usually see the author saying something like

>> This program is public domain and should not be sold for profit.

To me this means pretty clearly that public domain software shouldn't be sold
to make a profit (and if you buy any at profit making-prices perhaps you
should look around a bit better first because - at least in the UK and
Germany - many PD libraries exist which are run as non-profit making
organisations).

713. MSDOS formater

Newsgroup: comp.sys.atari.st
Date: 1991-01-24 09:13:41 UTC
From: hofer@urz.unibas.ch
Message-ID: <1991Jan24.101341.1327@urz.unibas.ch>
Source record: 235484

Is there a PD diskformater around, which produces real MSDOS disk, except that it puts in a serial number? I mean it should write a MSDOS bootsector (except serial number), a compatible media byte, the FAT and the root directory should have the same length and it should write the same number of FATs as on MSDOS disks. Is there such a beast around?

Not true since TOS 1.2.

>i already mentioned that the program can make a call like this to force
>old, compatible behavior:
>
> Fcase(CASE_OFF);
> ... (*VERY* well detailed explanation deleted)

This is a nice little idea but with the ST disk format being compatible with
the PC's at the current moment, disks with this system would cause havoc on
PC's as well as old ROMs. PC disk compatibility is one of the best decisions
Atari ever made for the ST.

I remember that before 1.4 (shudder) sometimes two files of the same name
would turn up. I beleive the phenomonon (?) was due to a bug in Fcreate.
Anyway the effect was a pain in the *&%. Disks with the *new* system and
having filenames would make the problem more prevalent to old ROM users.

While a program writing a file can check which TOS version is in the machine,
an old TOS version can't be expected to understand what a new TOS version had
in mind when the file was written.

And that my friends is why Atari will *NEVER* implement that system.
I don't blame them. Unless they release new TOS versions every 2 months,
and I sincerely hope they will, backward compatibility MUST be maintained.

715. System for sale - revised

Newsgroup: comp.sys.atari.st
Date: 1991-01-24 10:01:28 UTC
From: fer9483@tesla.njit.edu
Message-ID: <1105@tesla.njit.edu>
Source record: 235458

Ok, here's an update on my stuff for sale (with prices this time..)

Separately:

Atari 1040st, DS drive, TOS 1.4 : $275
Atari color monitor : $175
Atari monochrome monitor : $70
Cartridge Clock : $10
WordUp! 3.0 : $15
Quick St 2.2 : $7

Packages:

1040, color monitor, clock : $425
1040, color, mono, clock : $480

Everything, plus a panasonic kx-p1090 9 pin dot matrix printer (works, but one tractor clip is broken, can be replaced for $3.00) plus whatever programs and disks I have lying around : $540

Please respond vie EMAIL or call 908-276-9667 and leave a message. I would rather you call than leave email.

Once again, the printer DOES work. The only real danger is if you want to do a really long printout, sometimes the paper gets off line because the tractor moves. remember, it can be fixed for like $3.00

Everything comes with cables (except the printer) and with whatever manuals I have left. Software (commercial) comes with documentation. And computer comes with the mouse..

I also have a 6 chip set of Mega TOS 1.2 if anyone wants it for like $15

Printer comes with 4 extra, unopened ribbons.

-Frank Rachel

I am not aware of being able to do this and anyway it would cause the
variables not to appear if you are not using GDOS.

>VARIABLE=value
>
>like the path commands?
>

This is exactly right if you are using ENVIRON.PRG (in your \auto folder).
The data is held in the root dir in ENVIRON.DAT. This is what I do & it
works fine.

On atari.archive the file is utilities/environ.arc or it comes on the
geminiuk distribution.

Cross-posted to: rec.games.misc,comp.sys.atari.st,comp.sys.amiga.games

Firstly thanks for the level 5 suggestions. As it turned out the turnaround time (about two days) between posting a query and getting replies had allowed me to do those bits anyway on my own.

Anyway I've moved onto level 8 or `the arena' as it's called and have concluded the level of difficulty has jumped an order of magnitude. The place is huge and the chances of being taken out by the fireball throwing machine seem a bit high. I know I can use a fireshield spell and I've found the Staff of Hanah which has its own fireshield but unfortunately I've been so slow the thing runs out of fireshield. Does it recuperate or does it only last a few goes ?

Anyway, I presume there is a means of switching these sodding fireballs off or is there ?

I'm told there is very very long corridor accessed by a secret door/room but I can't find the button/pressure pad for it. Can anyone give me some directions to this button from say the entry staircase from the Tomb of the Firestaff ?

Thanks for any help.

This depends on the TOS version. With TOS 1.0 I couldn't extract a file
from a ZOO archive with the x option when I started ZOO.TTP from the desktop.
TOS translated everything to uppercase and the X option is illegal with ZOO.
I had to use the -extract option.
After I replaced TOS 1.0 with TOS 1.4 I can use the x option. The X option
still generates an error message.
So TOS 1.4 is case sensitive, it only translates FILENAMES to uppercase.

From what I've been able to discern, the Mind Bomb Demo was released as an exclusive disk to (I believe) Budgie in England. It isn't to be sold through PD libraries, and I don't know if it is posted on any of the archive servers. Perhaps one of our readers in Great Britain can give you an address and the cost of the demo.

This is an interesting and troublesome posting. I purchased ATSpeed from Talon at the end of December. I was having a couple of problems with it at first, so I called them a few times. They were very polite over the phone and tried to be helpful...unfortunately, the final bit of info they gave me was incorrect, or at least I could not get things to work the way I understood their instructions. Since things were working at least enough for me to do what I absolutely-positively need to do, I decided to go the rest of the way via a letter (just like Alan tried). The letter went out Jan 2, 1991...I still have not gotten a reply. Now, I am willing to agree that considering mail time, it is still early to assume that they are simply not going to reply, but it would be interesting to hear from others if Talon answers letters or not. Any other experiences out there? (I'll try to remember to post again in a while if I do not hear...and I'll certainly try to remember to post again if I do hear!)

>
> 5) Can I still backup my Spectre partition w/o ICDs software????
>

This is how I do these 5 things.

1. and 2.
I use FIND (posted long ago) to identify files and groups and CPIO corrupted from the UNIX specs, with a CT driver embedded. Really, about all that I use this for is to exchange data with UNIX systems.

3.
According to the specs, you cannot APPEND to a CT. In fact, the Adaptec 3530 interface enforces that. Simply put, you cannot write after a read. This does not prevent putting multiple files on one tape: it just has to be done as one continuous set of write calls.

4, and 5.
This is my main use for CT. I build a list of partitions from a drive (not necessarily contiguous) and output them as files to a CT. Any partition works: TOS, MINIX, Spectre, as long as they show in Sector 0 of the hard disk.

A TOS partition, that has been saved on a CT can be read and interpreted to retrieve files. I hacked up the MINIX tos.c command to do this. It is of much less use that just overlaying a partition with the CT file and sucking out the wanted files. This works best if the CT can be selectively read into any partition on and disk. My program does this; if you write your own, remember to limit the transfer by the size

of the receiving partition!

I haven't found a *good* use for the Darkness spell either, and I've found that the Invisibilty spell doesn't do anything for you -- at least it didn't confuse the monsters I tried it with. (Maybe they could smell Stamm, or hear Tiggy giggling?)

For mapping out the dungeon, I've found the Magic Footprints and the See Through Walls spells to be especially useful. See Through Walls also works on doors, and can warn you of upcoming monsters.

I'd like to know what the different types of armor do for you. Obviously, the mithril items offer good protection with much less weight than old iron armor, but what special protection does Flamebain afford you? And what's the difference between the armor of Lyte, the armor of Darq, and plain old iron armor? And what happens if you use cursed armor or weapons?

(Could be that the best answer is the most obvious: they just make the game more fun, but they have no special effect on the outcome. There is SO MUCH crammed into DM that the designers have to have left something out.)

>George

Try placing something on the ground in the blue haze while standing
infront of the gate.

I could, also, do with some help on this level if at all possible.
There are three trouble spots for me. If I can sort out one of them out, the
others may sort them selves out.

1) How do you get passed the 'Test Your Strength' message.

2) The gate that is just alittle further on but has no apparent
key hole or switch.

and 3) The key to the double doors just after the gate in 2.

If you can help with anyone of these three I would be greatful.

I have actually made it down to the level that needs the (ir?) key
to enter, but can't find the key so I hope the answers to the above will
help.

Cheers,
Ian

Quick Find in the Quick Tools package from Branch Always Software will support setting/unsetting any attribute, including the fast-load bit. You specify files by wildcard, so you could easily set the fast-load bit on all *.PRG files (though you might need to individually unset a few of them if they break).

731. Re: SM124 monichrome monitor problem...

Newsgroup: comp.sys.atari.st
Date: 1991-01-24 18:30:10 UTC
From: scott@tab00.larc.nasa.gov
Message-ID: <SCOTT.91Jan24133010@tab00.larc.nasa.gov>
Source record: 235493

> I've had this SM124 monichrome monitor for about ummm...5 months and it
> has a lot of extra light around the used portion. Is there an adjustment
> for this (inside the monitor maybe?)? Help!

I have posted this once before to comp.atari.st.tech but I received a grand
total of 0 responses:

1) My sm124 is SLOWLY sliding the image to the LEFT. The image still does not
cover the entire screen, but that is ok. I have not modified this monitor in
any way, but the 1st and 2nd column on my 80 column screen are now compacted
almost into a single vertical line! Help?

2) I am looking for the STOS patches for TOS 1.4.
Is this PD, is there somewhere I can order it? PLEASE, anyone?

I have STOS and TOS 1.4 and my STOS is DOA.

Scott

732. codekeys

Newsgroup: comp.sys.atari.st
Date: 1991-01-24 18:42:25 UTC
From: Bryan_Jones_Woodworth@cup.portal.com
Message-ID: <38419@cup.portal.com>
Source record: 235496

Yes, CodeKeys can record any event, as long as you have control over the system. That is, as long as you can load the .ACC or .PRG and access it, you can use CodeKeys.

Needless to say games won't work with it.. the bootsector-initiated ones.

It is a VERY VERY VERY VERY VERY GOOD PROGRAMME and I have found it very useful.

Source record: 235497
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

HELP!

My beautiful SM124 monochrome monitor seems out of adjustment. In the middle it looks perfectly crisp and clear. However, the further you get towards the ends (left/right margins; top and bottom of screen), the more muddled and blurry the display appears.

Are there internal "pots" that I can tweak in order to correct the display?

I am a novice, but I do not feel like giving the local Atari ripoff-dealer $100 to do something I can do myself using a little caution, etc.

What should I do: Use a plastic screwdriver?? Help?? Never done this before. Not even taken apart a TV!
Thanks,
(email or post to net is fine)

My Atari 1040ST and all that goes with it is for sale. Here is what I have:

4MEG 1040ST
Color Monitor
Monochrome Monitor
360K External Drive
DeskCart Cartridge
VIP Spreadsheet
Word Processors
Telecom Softwares
Many other programs

I have been using an IBM computer here at work for a while and would like to be compatible (so I bought a clone). The Atari works great. But it is not being used now. I do not know what the going price would be. If you are interested, Email an offer. Include your telephone number too.

Thanks,

Marshall

Well, the weird thing is that my roommates Zenith clone with a 1.44Meg drive could read my TOS 1.0 disk when it was extended formatted. (80 tracks with 10 sectors per track, I haven't tried it with 82 tracks) I never figured out why his computer read it while my other roommate's clone couldn't.

Oh well, I guess this is what makes computers so exciting!!!!!!!!!!

>
> Thanks for any help.
>
> George

This caused me a problem also. The solution is easy though....

1. Go and face the lever and operate it. The teleport will switch off.
2. Turn round 180 degs. Go one pace (only !) forwards.
3. Put (say) a club on the ground
4. Turn around and operate the lever, the gate will open.
5. Fetch the key.
6. walk into the teleport
7. recover item left on ground (club)
8. push green button
9 walk out of room shutting door behind you (always a good idea)

Hey Presto !

I'm quite pleased to have answered a DM1 query for once instead of asking questions all the time !

You wait 'til you get to level 8. AS a tip get your preist levels up for level 8 as your gonna need them. Just do a few spells with no things around to bother you before you descend to the first really tricky level. And to think I got stuck in level 3 ! DM has to be one of the best games around.

>After I replaced TOS 1.0 with TOS 1.4 I can use the x option. The X option
>still generates an error message.
>So TOS 1.4 is case sensitive, it only translates FILENAMES to uppercase.

probably semantics or splitting hairs, but the 1.4 desktop is now case sensitive when dealing with .ttp dialogs, at least. TOS itself (or probably more properly GEMDOS), when dealing with filenames and file operations (notably GEMDOS Fopen/Fcreate/et al), remains case insensitive, forcing file names to upper case. my entire point is that there is no inherent reason to force upper case in GEMDOS, really. the actual bytes representing the file name written to FATs need not be upper case or lower case, but can be any ascii char. i believe it is GEMDOS which defines legal chars in file names. all i was asking for was a way to toggle GEMDOS into expanding this definition of legal chars as to differentiate between upper and lower case letters.

and regarding breaking programs, i suspect that since if u pass Fopen a ptr to string "file.nam", on return, the string IS CHANGED (a definite "bug", IMHO, that i've always detested), forcing you to change your idea of the filename, programs have the modifications mentioned when parsing a filename AFTER an Fopen/Fcreate/etc and probably because of this flagrant disregard for sanctity of user data. such parsing may be done to isolate paths, extensions, etc, tho these examples look for non-letters (i.e. ".", ":", and "\"). drive letter seems like the only real reason to worry, or perhaps extensions. so rather than strcmp/strncmp, use stricmp/strincmp (ignore case). and yes, i know these are not in POSIX/ANSI C...

>Atari ever made for the ST.

yes, so let the power be in the user's hands to control how he wants to use
his sytem. if i toggle "old mode", it should not make any difference to the
PC. granted, i have to remember to do this, but then i also have to remember
to turn the computer on before i can use it :-).

>While a program writing a file can check which TOS version is in the machine,
>an old TOS version can't be expected to understand what a new TOS version had
>in mind when the file was written.

again, you, the user, could always toggle to "old mode" and NEVER have a
problem (from the desktop or with a trivial cmd shell oriented program).

ok, enuf of this. it'll never happen (tho i still think it should)...

i, too, get this only on the right edge where it is less of a problem. it seems to start after the monitor has been on for an hour or so. if i let it cool off, it returns to "normal". i do remember reading a note on how to fix this, maybe a year ago, but i do not know if i still have the note. i think it requires making some adjustments inside (screen width or something).

The absolute best way to do this is with Universal Item Selector III. It
replaces the standard GEM file selector with one that allows you to do all
kinds of neat stuff (including that which you need). It also comes with a
accesory that calls the file selector for you. This is one of those "must
have" programs!! It costs about $15 from any mail order place. Make sure
you get version 3.

Yikes! Be cool, these guys do us a great service just from the kindness of
their hearts! I find that the easiest thing to do is to check the newitems
section every couple of days (you could even cron this to work automatically).
I suggested a REVIEW folder a couple of months ago, where people could put
small text files outlining what a program does and how well it does it. I
sheepishly admit that I never got on the ball and sent any reviews, but the
atari.archive folks said they could do it. I will send some review files
in the next couple of days, ending in ".review". Please, if you are using
a program from atari.archive and you like it, do the same. Since most of
the stuff comes with doc files, I guess just a short description of the
program's function, any errors or bugs encountered, and perhaps the names
of other programs that do it better/worse would be sufficient.

The first time a friend of mine used this option, it destroyed several binaries on his HD. I don't know which version he used, perhaps the problem is fixed now.

I can't explain your situation - the only (IMHO) possible explanation would be that your fat is so much garbled that it always points to the old data - even if this would be true - strange !

solution: before you start to copy/zero, backup and try another Optimizer/Cleaner named Harddisk Sentry - very reliable - gets things back to work in most cases.

I remember seeing the cartoon type demo called Catnap once awhile ago , and
I remember that there was a SND file for it on Compuserve (When I HAD a
account there!) . Anyways does anyone out there have this file? Is there
a FTP site to get it? Any other AVS type demos.

Thanks for the info
Mark (Trying to find a demo to show off 4 Megs!)

750. Re: DM1: Some Spells...

Newsgroup: comp.sys.atari.st
Date: 1991-01-25 02:37:54 UTC
From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <38442@cup.portal.com>
Source record: 235376
Cross-posted to: rec.games.misc,comp.sys.atari.st,comp.sys.amiga.games

John Upham asked about light and darkness spells in Dungeon Master..

The "magical torch" spell given on the scroll in the Hall of Champions is a very easy to perform spell, suitable for beginning Wizards... the light it produces is relatively short lived however...

The "light" spell found much further down in the Dungeon is more difficult and costly of magic, but generates light for a far longer time..

Darkness, according to FTL, will allow you to escape detection by "certain" monsters... they wouldn't say which ones. I never used it in DM, and only tried it once in CSB for a particular situation (which didn't work).

Invisibility is an *extremely* short lived spell, even at maximum power. Theoretically it will let you slip past monsters, but don't count on it. Also, attacking monsters while you're invisible will result in your getting attacked in return...

Wrong ...

Hit 'n' now to skip spoiler ...

You have to stand facing the lever. Switch the lever off and move
backwards with the back arrow key and you can hit the teleport field
before it shuts off. You can then get to the key.

Migraph, briefly, offered for sale a postscript printer driver that allowed output from Easy-Draw to go to Postscript printers or to a Postscript file. It is no longer available from Migraph. Do any of you netters have any experience with this product or know where it might be available? Any such information would be appreciated.

Thanks in advance!

755. HELP again; what *IS* wrong with my drive?!

Newsgroup: comp.sys.atari.st
Date: 1991-01-25 04:21:00 UTC
From: kuento@kuhub.cc.ukans.edu
Message-ID: <28139.279f5dcc@kuhub.cc.ukans.edu>
Source record: 235367

Pardon my editor if this message is glitchy. I'm using Interlink ST
and it doesn't seem to be compatible with emacs on the VAX I'm logged
on to. That's a problem in itself I wouldn't mind answered, but not
why I'm osposting. Some of you may recall I had an Atari shipped to me
a while back, and that it's had drive problems - at first it looked as
if it might be loose chips, then a head alignment problem. An IBM
repair guy told me it was the head alignment, but that it was not a
fixable thing. He charges me 40 bucks and tells me to buy a new drive.
I post here for advice, and get much help...but as I compile the
advice, I toy around a bit, and LO AND BEEEHOLD! Some of my software
runs perfectly, including my Interlink disk...while *most* of the
stuff does *not* run - and it doesn't seem to matter where the disks
are from (no pattern discernable as to commercial vs. this machine vs.
my brother's machine...). The thing is, once the machine has been up
and running a while, some of the non-functional disks will run, and in
some cases, even the programs on them will run! While I admit I know
little tle about hardware, it strikes me as hard to believe that if
the problem with this drive is such that just warming the machine up
can make it go away, that ican still be literally impossible to fix...
One person (Terry Wells) has already suggested to me that this
sounds like it may be a problem with drive *speed* rather than the
alignment; do others agree with this assessment, or have an
alternative
diagnosis that would also fit these symptoms? Most importantly, does
it sound fixable, or shoould I go ahead with arrangements t
to purchase a new drive anyway?? Oh, how I wish there was someone who
knew how to fix Ataris that was within 100 miles of me...well, there's
one, but he's never in, he's too busy to take on any new jobs (if it
requires servicing), and it's a long-distance call, anyway. I seem to
get better answers from the Net! You folks are life-savers! Thanks
again to all who send me replies!

756. "C" escape codes needed

Newsgroup: comp.sys.atari.st
Date: 1991-01-25 04:31:24 UTC
From: kuento@kuhub.cc.ukans.edu
Message-ID: <28140.279f603c@kuhub.cc.ukans.edu>
Source record: 235366

As opposed to my usual pleas for help with my drive, my brother in New York (who also has an Atari, but no modem), has asked me to request of the Net the following:
He's doing C programming, and needs to know all the various "escape codes" that control the printer from directly within the C program. He says he knows *some* of the codes, but that there are some he doesn't know, and he's looking for a list of some sort that describes them all...or something along those lines. Those of you who do C programming probably know whereof he speaks. I'd like to get responses e-mailed, but if this isn't common knowledge, perhaps it should also be posted, as I'm sure it's of general interest.
Thanks,

On the wall in the lower left corner of the arena(if you are facing
out from the stairs) there is a switch on the wall. This switch opens up
a secret area right next to it where there is another switch. This second
switch turns off the first forceshield (the forceshields turn the fireballs
making them seem to fly about at random). The fireballs will now slam
harmlessly against the wall next to you. The fireballs originate in this
corner.

> FATs as on MSDOS disks. Is there such a beast around?

I've got some answers, but none of them did answer my question. So I have to
clarify myself. I know that there are tons of utilities, that write MSDOS
kompatible bootsectors. One of them is the formater of TOS 1.4. But I look for
a formater that also writes all the other stuff ecaxtly like MSDOS does in the
standard way. So that after formating nobody can see, if it was formated on a
MSDOS PC (say MSDOS 3.2) or on the ST. The use would be, that no utility that
claims to read/write MSDOS disk would deny to handle such a disk. The utility
could be on any machine (Mac, SUN,...). There are such utilitie, that only
partaly handle the MSDOS bootsector parameters. One is GEMDOS another is MSDOS
itself.

There is a program for parallel communication available in Germany, but I dont know the name or where to obtain it. Sorry, but keep looking.

There is however a program for serial communication using xmodem. It is very small (about 2K) but useful program. It can transfer text (thus turning the portfolio into a serial terminal) and binary files. All you need is a terminal program on the ST (Uniterm works) and a serial cable.
The program comes from Holland and is part of a book called "Das Portfolio Praxisbuch" which is available in Germany.

Greetings from another portfolio fan!

psurge@cs.utexas.edu (Troy Carpenter) writes:

>How does one get a program in either of these languages to use arguments passed
>from the command line.

It's quite easy if you get the adress of your program's basepage. The adress of the command line as passed to the program is found in the basepage (sorry I don't know the precise offset). This is a pointer to a string of bytes terminated with a 0-byte. I dont know houw to get this using Pascal or M2.

Getting hold of the program's calling name is not possible by legal means. You can of course check the basepage for the paren't basepage, check this one for the user stackpointer and use that in turn to get the parameters of the last command executed, which is Pexec with one of the parameters being the calling path of your program.

My recommendation: turn to the true programming languages, use C and leave that problem to the runtime library. Pascal and M2 aren't made to fool arount in the system on a level as deep as that one needs to know that a byte is 8 bits long. :-)

Greetings to US, give my regards to JR

764. Re: Which Modula2 compiler ?

Newsgroup: comp.sys.atari.st
Date: 1991-01-25 13:07:34 UTC

Source record: 235353

vdlaan@pttrnl.nl writes:

>I want to buy a MODULA2 compiler for my ST

The very best M2 compiler is a C compiler: faster, easier, better. Use the following:

```
#define BEGIN {
#define END }
#define INC(x) (x)++
#define DEC(x) (x)--
#define PROCEDURE
#define MODULE
```

If your M2 programs don't compile with that, buy a book named "The C programming language" and have "rm -f modula2" executed inside your cerebral data base. You will then see things getting a lot better. :-)

Greetings!

Okami-san

Making this work is up to the program you are Pexecing. Programs compiled with the Megamax C will work with both in and out redir.

>i have written a tiny shell, invoked by my cc(1) to start the various passes
>of alcyon, which normally cannot be redirected by gulam. i can mail it to
>u if u want.

I too have written a shell which all but tiny. The ttp is 125K, the sources should be about 10000 lines of C code. Is has ca 100 internal commands. Of your suggested features, it has:

> 1) pipes are a must, i.e. "ls -l | grep xxx | wc -l"

Yeah. Right this line should work: count all lines of a long file list that contain xxx.

> 2) args in quoted strings include spaces, i.e. grep "a string" file
> passes "a string" as a single arg to grep, with an imbedded space

Yeah too. You can also use single quotes to avoid variable substitution etc.

> 3) make it portable

Sorry, it isn't. It uses AES, GEMDOS and [X]BIOS plus some system adresses (0x400 onward) in direct access. However, it is C so if you dispense with some features the rest should be portable.

> 4) support MiNT (and add job control, if possible)

It is outlayed to support Mint (can read out the process table etc) but does not fully support job control. It will as soon as Mint supports the Micro Emacs Editor!!!!!

> 5) RELEASE SOUCE CODE!!!! then the rest of us can improve your work
> (and be more productive, since YOU also benefit from these
> improvements)

Source code is available from me. It costs just one pocket calculator.

> 6) personally, i like history accessible via emacs/vi/cursor keys
> a l tcsh/ksh.

History can be accessed with the cursor keys. You can:
press Uparrow and recover the previous command line,
press Ctrl Uparrrow and execute the previous line,
type foo and press Shift Uparrow to recover the last command line
beginning with foo, where foo may contain Unix wildcards (*?[]).

> 7) command prompt should be able to deal with imbedded escapes
> (i.e. ESC p/ESC q for reverse video). gulam gets confused

Yeah. The escape character is the circumflex since the backslash is occupied
by Tos. Example:
echo ^033pThis is inverse^033qthis is not

> 8) make it possible to redirect inside scripts

Yeah, as well.

> 9) make it possible to do things like "sh file" (or, if memory
> serves, "echo 'command' | csh -s")

Yeah.

> 10) loadable common programs (cat, ls, grep, etc) which stay
> in memory (i'd rather have them in /bin, too)

Most common programs (including cat, ls, grep [but not including etc :-)])
are built-in. It is possible to keep binary programs resident and execute
them via shell functions.

> 11) support something like SLASHCHAR env variable, so cmd lines
> can use either "cmd /path/file" or "cmd \path\file". shell
> translates according to SLASHCHAR before exec'ing cmd. it
> would be nice to support alternate device names, e.g. "/dev/c"
> for "c:" in cmd lines and scripts.

You can set a flag which when active translates all slashes to backslash.
It is still possible to use slashes by quoting them.

> 12) soft links would be a definite plus, if u feel ambitious...

Not yet, sorry. Not planned, not considered really useful unless done on
OS level.

Some other features of the program (called the Okami Shell):

Shell functions (=resident scripts), hash table to shorten program search time,
shell varaiables, a built-in RPN calculator with some 80 functions, terminal
emulator, terminal server and many, many things I dont really remember...

In general, it closely resembles the Bourne Shell with most of its specialities (like the type command, $CDPATH, $PATH, export, hashing etc). It's a very solid piece of software. If you find some of the built-in commands unuseful for you, you can get a version without these, thus making the program smaller.

It has only two drawbacks:
1) The documentation (about 200K) is is German. Sorry, but I have no time to translate it. It has however a help file with brief explanations which is in English. Maybe you find somebody who is able to read the German documentation.
2) I do not know how to get it by email. There might be a version in the Fido net, so look in the lists of the German nodes (the city is Aachen, try a mailbox called "Uniline", although I am not sure). A safe way to get the Shell is to send a diskette to the following adress:

Wolfram Roesler
Augustastr. 44-46
5100 Aachen
Germany

(not West-Germany anymore, fortunately) Dont forget a stamped and adressed return envelope. If you want the sources, dont forget the pocket calculator (if you include a Hewlett Packard you will get the following 10 releases of the shell free of charge).

Hope to hear of you!

Greetings to those who prefer Unix to Msdos and a command shell to mousing

wr

> -- bemo

It principally is possible. A PC can read ST disks without problems. Reading
an ST disk on a PC is a matter of the formatting program (has sth to do with
the bootsector entries etc).

>24-pin screen dump program. I'll post it to atari.archive.umich.edu.
>- STE medium rez program (for a friend)
>Do you mean a medium res emulator for monochrome monitors?

Firstly, thanks for replying to my news. Alas, I don't think I
can access this atari.archive.umich.edu, would it be possible to uuencode
and send (if its not excessively big).

Secondly, the med rez program I had in mind, isn't an emulator, it's
a program to put in the auto folder, to change the desktop to medium rez.
Reason being, the STE desktop doesn't remember medium rez .INF file saves,
so you can only boot into low.

I'm still on the lookout for a selection of Signum2 PD fonts people.
Isn't there anyone out there using this package, with extra fonts to those
supplied. I have seen a PD library advertising a PD collection, but want the
ransom of 3 pounds 50.

Thanks,

Lee.

769. Results with packed programs?

Newsgroup: comp.sys.atari.st
Date: 1991-01-25 14:51:58 UTC
From: saj@chinet.chi.il.us
Message-ID: <1991Jan25.145158.10505@chinet.chi.il.us>
Source record: 235391

A year of so back, there were some programs posted (3 of them, I think) which compressed executable files. The word at the time was that while there were some cases in which they wouldn't work at all, they wouldn't 'half-work'. In other words, if a program one of them had been applied to ran for a while, that almost guaranteed that it would run the same as the original version.

Has anyone noted a counter-example? If a program is compressed and runs under (say) TOS 1.2, can it be counted on to run normally under TOS 1.0 and Rainbow TOS? How much confidence should we have in this process?

Steve saj@chinet.chi.il.us

770. Connecting a Fujitsu M2614ESA

Newsgroup: comp.sys.atari.st
Date: 1991-01-25 15:00:48 UTC
From: rs@heike.informatik.uni-dortmund.de

Hello!

Has anyone ever connected a 180 Meg Fujitsu M2614ESA to an ICD
host adaptor (ICD advantage micro/ advantage/ advantage plus) and
then to a 1040 ST? If yes: does this combination work fine?

Roland.

I would be curious to see some sort of list also. Near as I can tell, we have 520STFM,1040STFM,520STe,1040STe,Mega 2ST,Mega 4ST, Mega 1ST, STacy (not FCC approved for home use), and the TT (not forsale in US yet I think). All of these, with the exception of the TT, are basically the same machine in different boxes (though the STe's seem to have a little extra hardware for games included).

Where to buy one? That may prove to be a pain. In some areas, Atari dealers are about as abundant as Coors dealers in Saudi Arabia. :-) As far as the cost goes...I'm not sure what the going rate is, but a decent system will cost you (more or less) about the same as a 68000 machine from Apple or Commodore.

Cheers,

Chris

From kuento@kuhub.cc.ukans.edu:

> [My brother is] doing C programming, and needs to know all the various
> "escape codes" that control the printer from directly within the C
> program.

The printer control codes have nothing to do with the programming language you're using. Instead, they have to do with the printer you're using. Have your brother get hold of the printer's manual and look in the appendix at the back of the manual. He should find a list there of all the control codes.

If he can't find the manual, or if it doesn't have a list of control codes, then have him find out if it uses Epson, PCL, PostScript or IBM ProPrinter control codes. These are de facto standards, and the codes for them are widely available (in other printer manuals).

I received this mail message today and as requested I'm posting
it to the net. Most of it is really only relevant to people in the UK but
the last paragraph is possibly of interest to everyone. Please try and
reply to the proper person (i.e. not me) but anything I receive will be
forwarded.

Cheers,
Ian

Hi

I got your mail address from comp.sys.atari.st

I'm from the University of Kent, and am thinking of starting a
laser printing service to support `proffessional' ST applications
such as Calamus, among others.

I was wondering if you would be so kind as to answer a few questions
about what you might want from such a service, if you could post
the questions to comp.sys.atari.st I would be verry appreciative.

So, to the questions -
What software would you want to see supported
Would there be a demand for colour and slides
What sort of turnaround time would you like to see
How much do you pay at present for you printing
Where do you get your printing done?

Other comments...

I would also intend to put together an archive of printing related
PD and Shareware, storing image manipulation software, typsetting
languages, etc. Would people be prepared to send me their printing
related utilities?

Snail mail me - P. Caligari
Seasalter Cross House
Seasalter Lane
Whitstable

776. Mega 4 System for sale

Newsgroup: comp.sys.atari.st
Date: 1991-01-25 16:51:19 UTC
From: Xorg@cup.portal.com
Message-ID: <38462@cup.portal.com>
Source record: 235362

This is a "feeler", I will definitely be selling these items - but would like to get an idea of what I can get - if you like these prices, send me e-mail and odds good that are you will get them!

- Mega 4 ST. 1.5 year old Mega 2 with 2 additional megs of 80ns RAM memory *professionally* soldered onto the motherboard into Atari pre-drilled holes. (All the RAM chips are 80ns, I've seen some Mega systems with as high as 150ns chips in them!) Very quiet floppy drive. In outstanding condition, TOS 1.4 professionally installed.

$899

- ToadFile 44Meg SyQuest Removable hard drive.

Custom manufactured by the boys at Toad Computers. In an ICD-Style case which fits perfectly and quite attractively under the Mega 4 CPU. The case holds one SyQuest 44meg removable drive and has plenty of room for another front-access drive bay for a 5.25" floppy, 3.5" floppy, or another SyQuest mech. The power supply in the case will handle the extra drive with lots of power to spare. Also note that the case has two ports on the back for easy daisy-chaining of peripherals like an Atari laser or SuperCharger. Includes three pre-formatted SyQuest 44Meg cartridges. This drive is used as my main hard drive with simply outstanding results. The drive actually ran faster than my old Seagate 157N and the real beauty was the ease with with I could switch from ST mode, to Mac emulation, to PC emulation - all it took was changing the cartridge!

$725, including all 3 cartridges,
(the carts run $90-120 EACH if purchased seperately!)

- Spectre GCR The premiere MacIntosh emulator which not only runs 98%+ of all Mac software, but also directly reads and writes Mac disks. Includes the now very-hard-to-find MacIntosh 128K ROM chip set and 10 blank disks. All documentation and every Gadgets by Small newsletter is included in this package.

$375

- Atari SM124 mono monitor

In excellent condition, seen 1.5 years worth of use without any complaint. Includes the Atari monitor swivel

base attachment.

$125, $99 if purchased with Mega 4.

- Atari SC-1224 color monitor

Also in excellent condition, seen almost no use since
SM-124 was purchased. Very early Atari model which has
a far sharper picture than the newer Atari color monitors.

$199, $125 if purchased with Mega 4.

>>> Whoever purchases the Mega 4 may also buy BOTH monitors for $175.

- Epson LQ-850 24 pin dot-matrix printer

In excellent consition and seen very light use, used
exclusively as a backup printer (read> sat in its
original box) after purchase of Atari laser. Includes
two extra ribbons. Fast and quiet operation.

$389

- Puriden Power and Phone Line Surge Suppressor and Line Conditioner

This is a flat pizza-box style power base and surge supressor
the fits perfectly under the hard drive (so in my setup, from
bottom to top I have this power base which is about 1.5 inches
high, the ToadFile hard drive, the Mega 4 CPU, and the mono
monitor on top. This is a very high quality and all metal power
base that has a Master switch and seven individual switches for
the computer and up to six peripherals. It also has phone jacks
that prevent phone line surges from damaging your modem.

$75

- Master 3D 3.5" external floppy drive

Rated the best by STart magazine. Very small design and housed

in an all metal case barely larger than the drive mech itself!
Will read and write out to track 84 without complaint and is th
e
quietest floppy drive I've ever heard.

$99

If someone wants a superior and totally read-to-run ST power system, the packag
e
price is $2,299 and will include a ton of software, blank disks and literally
hundreds of dollars worth of other accessories including joysticks, printer
stands, blank disks, a pile of commerical games and application software, PD
software, magazines, and any and every thing else I have lying around that has
to do with the ST that I've gathered in the past four years.

I will even pay UPS shipping anywhere to the lower 48 states.

e-mail to 72637,2272@compuserve.com
or xorg@cup.portal.com

Thanx! Peter Szymonik

You are less than 10 miles away from Maryland's largest
Atari dealer -- Toad Computers in Severna Park, MD. Their
phone number is (301) 544-6943.

Looking at their wintertime catalog I see that Atari is now
making three lines of computers; the 68000 based STs, the
68030 based TTs, and the Portfolio (an MS-DOG based handheld
portable).

Since the Tramiel's acquired control of Atari the company
seems to have focused on the European market and, in the
opinion of many, ignored the domestic market. In Europe the
Atari is considered to be a serious computer, in the USA
Atari tends to be equated with toy.

As someone who runs OS-9 and MINIX on my ST in addition to
GEM =I= realize that Atari computers are more than toys.

> | |

Switch the lever L so that the haze comes on. Turn around and *set* any object
down in the haze. Don't throw it. It'll disappear and the door will come
open. You can go through the field and pick up what you sat down.

If you throw your object it'll just come flying out the other side.
Setting it down will make it stay on the pressure pad in the NW corner.

- (When I HAD a account there!) . Anyways does anyone out there have
- this file? Is there a FTP site to get it? Any other AVS type demos.

I have the animation file, but no sound. If someone could get me the
sound for it, I'd put them together and post them to atari.archive.
If you want me to post just the animation, I could do that too.

I have a few AVS demos. One is called Cola Wars and is pretty good.
I have another called The Runaway Cat, which features a Caterpillar
tractor. There are a couple I can't remember.

- Mark (Trying to find a demo to show off 4 Megs!)

Catnap will do it. If you just want to show off your ST, there are
other demos (at atari.archive) which will do it better than Catnap.

>
>Hey, I just remembered, my monitor did that when I first got it, so took it
>back to the dealer - it must be a common problem, surely SOMEONE knows why
>it happens?

I have seen a few monitors do this; my own moves over about 1/8" between fully cold and fully warm. There might be a hardware problem here, but I don't really know. However, it is possible to manually adjust the left/right picture (among other things) if you open the monitor up. The plastic screw to do this is reasonable well marked, and you will need a fairly long, non-conducting screwdriver.

WARNING: Your monitor can kill you. A cathode ray tube acts as a giant capacitor; it can store about 50000 volts even when the monitor is unplugged. Touch the wrong thing and it will stop your heart. You won't even have a chance to finish fixing your display.

Basic monitor adjustments are easy, but you MUST know what you are doing.

Hope this helps
-sam

784. sunclock

Newsgroup: comp.sys.atari.st

:In article <1991Jan24.101341.1327@urz.unibas.ch>,
:hofer@urz.unibas.ch (Remo Hofer) writes:
:: Is there a PD diskformater around, which produces real MSDOS disk, except
:: that it puts in a serial number? I mean it should write a MSDOS bootsector
:: (except serial number), a compatible media byte, the FAT and the root
:: directory should have the same length and it should write the same number of
:: FATs as on MSDOS disks. Is there such a beast around?

:I've got some answers, but none of them did answer my question. So I have to
:clarify myself. I know that there are tons of utilities, that write MSDOS
:kompatible bootsectors. One of them is the formater of TOS 1.4. But I look for
:a formater that also writes all the other stuff ecaxtly like MSDOS does in the
:standard way. So that after formating nobody can see, if it was formated on a
:MSDOS PC (say MSDOS 3.2) or on the ST. The use would be, that no utility that
:claims to read/write MSDOS disk would deny to handle such a disk. The utility
:could be on any machine (Mac, SUN,...). There are such utilitie, that only
:partaly handle the MSDOS bootsector parameters. One is GEMDOS another is MSDOS
:itself.

I use PC-Ditto I (the 8088 emulator in software version) on
the ST and format using PC-DOS 3.3. If you must have
PC/MS-DOS formatting why not go to the real thing?

>to make a profit (and if you buy any at profit making-prices perhaps you
>should look around a bit better first because - at least in the UK and
>Germany - many PD libraries exist which are run as non-profit making
>organisations).
>

As soon as an author says a program is public domain, he loses all control over it. The phrase "should not be sold for profit" is just the author's opinion and carries no legal force. Whether it carries any moral force is up to the individual. If someone wants to sell a public domain program, that's between him and the buyer, and there's no legal reason he can't do it.

If you really want to insure that a program can't be sold for profit, keep the copyright. Then you can place as many or as few restrictions as you want on it's distribution, including prohibiting sale for profit.

From: rcte2p@jetson.uh.edu
Message-ID: <8324.27a065e6@jetson.uh.edu>
Source record: 235301

I have a few questions to which I hope some of you have the answer:

1) I am interesting in running a unix flavor on my ST. Currently I have a 520ST that is expanded to 2.5 Meg. I have 1 DS floppy with plans to add a hard drive soon (waiting for IRS Refund!) Anyway, I wonder if anyone can recommend a good system to set up. I have heard of minix, but I would prefer something that is shareware or PD. I basically want to run a UUCP connection to my home from the university I attend. I am sure that I can get UUCP set up. This leads me to my second question,

2) I am interested in UUCP. What do I need to get things set up to get my email and stuff? Arangements with the university should not be a problem. I need information on what software I should use, what requirments there will be of my system and some sort of shell program that can simulate a 'crontab' to automate my uucp transfers...

3) Does anyone know anything about X-Windows on the ST? I have tried and used Unix Windows but I gave it up because of its slower speed than Uniterm. Or has anyone optomized UW. I also have a suggestion to anyone that is... Have the mouse curser off until the mouse is moved. It is annoying to see the mouse flicker as the screen windows update.

4) What and where do I find a good C shell and C compiler? I have looked at Sorzobon(sp?) and it seems ok.. I just am looking for more of an intergrated environment. Has anyone written a GEM based shell to use for this?

I hope my questions can be answered. Thanks

saj@chinet.chi.il.us (Stephen Jacobs) writes:

- Has anyone noted a counter-example? If a program is compressed and
- runs under (say) TOS 1.2, can it be counted on to run normally under
- TOS 1.0 and Rainbow TOS? How much confidence should we have in this
- process?

I don't know if you want to limit this to PD/Shareware programs, but
I've been using DC Squish (a commercial program that's included with
the DC Utilities disk) for as long as I can remember and have NEVER
had a problem with it. I squish everything -- desk accessories, TSRs,
and executables. I'd be very surprised if my files wouldn't work on
a machine with a different TOS. In fact, before I got my STe (TOS
1.6) I think I had some files squished using TOS 1.0.

Hope this answers your question somewhat.

Hello,

I was wondering how the MiNT project was progressing, and if I could get involved in this work? My trouble is that this site will no longer be receiving private mail (not to mention, we won't be renewing this account next month), and further, my access to the outside world both at compuserve.com and utoronto.ca is limited, so I can't conveniently contact one of the archives to obtain the sources for this system.

I was wondering if anyone could mail me the sources to this wonderful system so that I could have a look them and work on what I can. I understand that the latest incarnation of MiNT is 0.7.

I've been able to receive mail reliably at this UofT address:

a209onys@one.utoronto.ca

At compuserve, I think my address is:

73700.3114@compuserve.com

Thanks in advance!

>Thanks,

Printer ``escape codes'' vary. Every printer manufacturer includes them
in the back of the printer manual. The Epson printers probably are the
most common; the LX-80 manual devotes 11 pages to printer control codes.

Best bet is to find out the type of printer, then find somebody who has
a manual for that printer (or a compatible) and copy the info.

- Some people say we can use 2 x 1Meg SIMMS and 2 x 256K SIMMS to make
- a 2.5 Meg STE system.
-
- Is it actually reliable and supported by ATARI ?

I'm using a 2.5meg STe. The only problem is that it thinks it has
4megs in it. When I get passed the 2.5meg point, that's when it
starts crashing and locking up. There's a program called SIMMFIX
which reprograms the MMU and TOS to tell it that there's 2.5megs, but
it requires a warm-boot after it loads and is kinda cumbersome.

Depending upon how I arrange the SIMMs, the STe thinks I have 1meg or
4megs, with varying degrees of reliability. The best arrangement so
far is 1meg/256K/1meg/256K (if you started from the back slot).

- Firstly, thanks for replying to my news. Alas, I don't think
- I can access this atari.archive.umich.edu, would it be possible to
- uuencode and send (if its not excessively big).

I'll send you a copy.

- Secondly, the med rez program I had in mind, isn't an
- emulator, it's a program to put in the auto folder, to change the
- desktop to medium rez. Reason being, the STE desktop doesn't
- remember medium rez .INF file saves, so you can only boot into low.

Don't use STE_FIX.PRG (the program you're looking for). Instead,
load DESKTOP.INF into a text editor and change the 5th line, where it
has a 12, to 13. This tells the STe to boot in monochrome, but since
you use it on a color monitor, it drops down to the next highest res.
This is what I use; it keeps one more patch program out of the AUTO
folder.

Rejoice, Americans. I have just read in the german 'ST Computer' magazine
that Alwin Stumpf, manager of Atari Germany, is headed for the US. If his
performance here in Germany is anything to go by, you should see Atari
sales in the US go up inside half a year.

This will only work with MS-DOS. If you have PC-DOS (the version of MS-DOS sold by IBM) you need to use:

DEVICE=DRIVER.SYS /D:1 /S:10 /T:82

I believe this will also work with MS-DOS.

806. Grumpiness

Newsgroup: comp.sys.atari.st
Date: 1991-01-26 22:57:49 UTC
From: saj@chinet.chi.il.us
Message-ID: <1991Jan26.225749.5957@chinet.chi.il.us>
Source record: 235313

It seems that of all the frequently asked questions, the most frequently asked one is how to get a PC or compatible to read disks formatted on the ST. The amount of pessimistic mis-information on this subject is staggering. There are, to be sure, a number of formatting utilities which take care of the problem. But the quick and dirty solution works just fine: use a sector editor (DRFLOPPY or MEMFILE on the ST, Norton utilities or a bunch of others on the PC) to make the first 3 bytes on the disk EB 34 90. That's the first 3 bytes (in hex) of sector 1 of track 0 (or is it sector 0 of track 1--who defined this numbering system, anyway?). Works with any reasonable number of sectors per track. Twisted or straight sector ordering (twisting seems to speed up reading on PCs, also, by the way). Can't say anything about more than 80 tracks--I never do that one.

Sure there are demi-clones that do bad things with these disks. That isn't unique to this solution: I have had situations where a HP Vectra, a PC XT retrofitted with a 3.5" disk and a PS/2 would reject and/or mangle each others's disks. But this method works with genuine PS/2-s ALWAYS, and with other compatibles 'mostly'. And I use it CONSTANTLY.

>
>The very best M2 compiler is a C compiler: faster, easier, better.

Oh, please. C is not inherently faster than M2, it depends on the compiler. C is quicker to write, but harder to debug due to weak type checking, no bounds checking, and a shorthand syntax that makes typos easy to make and hard to detect. C is better for some applications, M2 for others.

For a discussion of the merits of each language, see comp.lang.c and comp.lang.modula-2. A blanket statement like "C is better than M2" is like saying "a hammer is better than a screwdriver". I've used both and I prefer using M2. Your mileage may vary. Each has features the other lacks.

809. CODEKEYS hmm

Newsgroup: comp.sys.atari.st
Date: 1991-01-27 00:56:41 UTC
From: ramsiri@blake.u.washington.edu
Message-ID: <15243@milton.u.washington.edu>
Source record: 235316

Well, my hopes were dashed. Thought i'd be able to use
CODEKEYS autorun macro to mark *.acc's to *.acx's and
vice versa when installing partitions with SOFTLINK.

What i dicovered (and should have realized) is that while
you CAN use CODEKEYS to open your C:\ and change acc's to acx's
etc.. you CAN NOT have change the directory (ie: added or deleted
files) nor can you have changed the window size and shape..
since CODEKEYS works on x and y coordinates.. if happen to add
or delete a file ..or if you change the window shape/size or
placement on the desktop, CODEKEYS will pick a different file-
whatever happens to be at those coordinates and change it!..

SO... i can't use it as a substitute for Superboot. Superboot
doesn't work for me becasue it fails to run when booting
partitions other than the first.

Anybody have any suggestions on how I can paste together a
program that will allow me to configure distinct desktops
under SOFTLINK and have these desktops loaded from bootup?

Thanks
kevin

I would really like to know how to get my Toshiba ND 3561BR to recognize disk swaps even when the write protect window is closed. It does recognize write protected disks and the disk immediately following. I understand that Gadgets by Small put in an F-1 key software fix for this. Is this available or is it part of Spectre GCR? Is there a hardware fix?
The Toshiba hardware tech rep told me that Atari did something with pin 2, so therein might lie the answer. I seem to remember last spring or summer something about this being posted here, but at that time I did not know I would be trying to cobble together a drive.
If someone out there has that info could you e-mail it to me? could you also post it? ASAP as else I will have to shell out for a complete drive. I'd rather not (much rather not). If you can't get it to me ASAP, but still have the info somewhere, I'd sure like it when you do find it.
Thank you very much in advance!

Atari does **NOT** support ANY memory expansion for ANY Atari product before the TT...

You buy it, and you take your chances on upgrading it...

However, the STe can be easily upgraded with SIMMs, *IF* your STe is equipped with SIMM sockets...

Is this Patch still needed with TOS 1.62, A friend of mine has asked
this Question on Genie, the Answer that he got back from Atari, was that
PoolFix was needed with TOS 1.XX, but a resent GenieLamp Mag, state that
TOS 1.62 does not need any Patches,?, is it posible to clear this up ??

Which micro-Emacs editor? There are several that I use all the time under
MiNT (including a version of mg that I compiled with the mint library,
so ^Z etc. work as they should). I've also heard that someone has ported
GNU emacs (the big one) to MiNT as well.

Do you have SUPERBTA.PRG in your AUTO folder? This allows SuperBoot
to run after a reset or warmboot, according to the docs.

-
- "Power without caring about the Customer"

Hey, at least Atari gives us the power. The other companies won't even give us that much.

BTW, I thought the TT was sold without a monitor, for something like $479. What forces someone into buying it? If it's not sold separately, please correct me. Makes the (lower) price of $2399 so much better.

Source record: 235330

I am in the process of installing LaTeX on my 1meg 520 (with MF30), and I find that no matter what I set the environment variables to (in gulam) that both showdvi and dviprint, can not find the proper fonts. In fact dviprint can not find ANY of the fonts. I should also note that I do not have the fonts in the standard (f:) directories. Could someone help me by telling me the proper directory structure. Are the fonts I found in tfm suitable? Do they have to have a certain structure (subdirectory) or can I lump them all into one directory. Thanks in advance.

In my experience, M2 is *much* better than C when engaging in a
multi-person project. You have to specify things more clearly, a
greater level of protection etc.. However, when writing a program by
yourself, I find M2 is a REAL PAIN. C wins every time.

Why do you prefer M2 ?

825. Rainbow TOS vs. older versions: problem

Newsgroup: comp.sys.atari.st
Date: 1991-01-27 21:10:40 UTC
From: spit@ruunsa.fys.ruu.nl
Message-ID: <1906@ruunsa.fys.ruu.nl>
Source record: 235332

I have a problem which I think is in Rainbow TOS.
When I format disks with Rainbow TOS it quite often
happens that my ST2 that is running TOS 1.2 can
no longer read the disk when it has become somewhat
filled. The problem doesn't occur with our 1040's.

Is there anyone who has some idea about what might be
happening?

826. Warning: HIDORAMA on STart disk

Newsgroup: comp.sys.atari.st
Date: 1991-01-27 21:20:33 UTC
From: silvert@cs.dal.ca
Message-ID: <1991Jan27.212033.23890@cs.dal.ca>
Source record: 235346

I just tried the program HIDORAMA on the Jan. 1991 STart disk, which is supposed to modify the attribute bytes so that you can set/unset the Hidden, System, and Protect bits on files. It is erratic in performance, since some hidden files vanish from the desktop and others don't, but it appears to have scrambled some directories. After using it one of my HD partitions vanished entirely, although it reappeared after a reboot. Whether any permanent damage was done I can't say.

I suspect that HIDORAMA.PRG does not always find the right bits to fiddle and that it is capable of doing damage. Until someone reports the details of the situation, I recommend against using it.

Mea cupla, and it's not my fault. Apparently, when a file has it's
PROTECT bit set, it ignores both the HIDDEN and SYSTEM attribues,
don't ask me why. I thought I had checked this before shipping the
stupid thing off to Start, but I just tried it and it doesn't work.
You can HIDE and SYSTEM files just fine, as long as they are not
PROTECTED as well. I'm a little confused why this does this, but
that's nothing new.
As to why you got "scrambled directories" and "disappearing
partitians"... Geez. I dunno. I've been using HOD for over a year
now and haven't had any trouble. What TOS are you using?
Damn, I HATE it when I look

>BobR

In fact, I DO own a very nice Quantum 80 that i would prefer to
use. I also have 4 megs of simms in my ST i could use (rather
than paying over $200/meg ATARI prices.. i seem to recall a $1300
price tag difference between the TT/2MB and the TT/8MB). In addition,
I would prefer a 1.44 meg floppy. There is no way i am buying
a TT until ATARI or some mail order company will sell me the
basic box.

I think a lot of others feel the same way...

What good is a box with open architecture if you can NOT
configure it to your own needs!

If this is any indication of ATARI's planned "support" for the
TT buyer.. good luck.

Cross-posted to: comp.sys.atari.st,misc.forsale.computers,ne.forsale

For Sale:

Seagate-277N 65Meg 28ms half-height 5-1/4" SCSI hard drive.

5 1/4" hard drive kit for the Atari ST:
(everything you need except for a SCSI drive):
15" x 5.5" x 7" metal case
fits 2 1/2 height drives or 1 full height
60W power supply and fan, 18" SCSI cable, and 3' DMA cable
ICD ST Host adapter w/built-in clock/calendar
(allows daisy chaining of the DMA port)
ICD hard disk caching software

I am interested in selling these separately or together.
The hard drive was used mostly for Wordperfect and this wasn't very often.
Best reasonable offer gets them.

Howard says:
>>If you already have a Quantum 80 or Syquest 44, you have to throw it in the
>>trash, or sell it in "Trading Times"... forget using it in a TT...

>Don't be ridiculous. The TT has external SCSI; you can hook up other
>drives without any trouble.

Yes, of course that's true... you can ADD anything you like to the TT...

BUT... if you already own a Quantum 80, you CAN'T use it as your
primary drive... you have to buy what Atari offers, THEN add your existing
drives...

Though, I suppose if you can afford a TT, you can afford to buy hard drives
at Atari prices...

> ... In Europe the Atari is considered to be a serious computer, in the USA
>Atari tends to be equated with toy.

It's a toy here too. To the best of my knowledge Atari UK never advertise(d) the ST as a serious business machine. At best a home business machine for folk who couldn't afford a PC or didn't know any better. It's games, games and more games for the ST on the UK. I heard that Mirrorsoft are apparently going to stop producing serious software so they can conecntrate on the 'leisure matket'.

>As someone who runs OS-9 and MINIX on my ST in addition to
>GEM =I= realize that Atari computers are more than toys.

Me too. But how do you go about convincing the business community that when most of them don't know what an ST is and their first question is 'Is it PC and MS-DOS compatible'. It's even tougher when you consider that Atari themselves aren't interested. It shouldn't be up to us to promote the Atari ST!

Perhaps I'm out a bit here, but didn't the ST come out about a year after the Mac? Hailed as the Jackintosh at the time, if Atari had not gone for the home market but had promoted it from the start as a serious machine, just think what it would be like today. I reckon their market share would rival Apples considerably.

Oh well, there is no use crying over spilt milk I guess.

There is a Pot to adjust this VR 701, this Pot is on the Main PCB,
Please Use a Long plastic trimmer or insulated screw driver, long = 10"
Please be carefull when removing the Back, as there are speaker wires,
they do unplug, but can be a bit tricky to plug back in.
VR 701 = Horiz centre...

>I would really like to know how to get my Toshiba ND 3561BR to recognize disk
>swaps even when the write protect window is closed.

I just glued down the little pin that senses "disk in drive" next to the
pin that senses write protect. Toshiba gated their write protect so it can
only change state with a disk in the drive. This befuddles the ST operating
system since it watches for fluctuations in write protect to detect a disk
change. Since the state can only change with a disk in the drive, gluing
down the disk change sensor made the write protect line function normally.

Such is the fix I used...
Put a drop of superglue on the offending switch (a tiny drop...)
Place a piece of waxed paper in place over the switch/glue folding it down
the face of the drive so you can hold it in place while inserting a disk.
Insert a disk to hold things lined up while the glue sets...

I'm sure there's a more trivial way... but this worked for me.

845. Atari.archive Monthly Posting

Newsgroup: comp.sys.atari.st
Date: 1991-01-28 14:45:01 UTC
From: weiner@terminator.cc.umich.edu
Message-ID: <1991Jan28.144501.2772@terminator.cc.umich.edu>
Source record: 235271

Welcome to atari.archive.umich.edu

This is the monthly posting from the umich atari posse. We hope
it will answer some of those nagging questions that always seem to pop up
from time to time. If you have any additional suggestions, please mail
them to me, at weiner@atari.archive.umich.edu.

1: How do I use BART?
Bart (Brode's Archive Retrival Thang) is our mail server. You can get
his help file simply by asking for it. Mail atari@atari.archive.umich.edu,
and type the word help in the body of the message. Further questions about
BART can be mailed to jon@atari.archive.umich.edu, NOT me.

2: How can I connect via FTP?
Well, we HAD a help file, but it was destroyed in the great AA crash and
I haven't yet had a chance to replace it. If you're interested in it,
please mail me and I'll rewrite it.

3: What if my machine doesn't support name service?
Two things to do here:1) Demand that your sys-admin install it soon,
and 2) use the internet address 141.211.164.8

4: I can't download because my hard drive doesn't work and my modem goes
out sometimes and .....HELP!!!
Sorry, outside of the archive I really can't help you....Your best bet is
to find someone at your site with a similar set-up, or post to c.s.a.st
for advice.

5: Excuse me, but your index sucks.....
I know, I know. I am working on it. Really. It's kinda tedious to index
169 megs of stuff. Please bear with me. The ls -lR index is updated about
two times a week, usually on Tuesdays and Sundays.

6: When I try to FTP to the archive's host, I get a message saying that my
machine wasn't recognized and I wasn't allowed to log in. What's up?
We only accept ftp logins from recognized hosts. If you are not allowed
to log in, please try again. It is possible that the DNS took a bit too
long. If you are still denied access, ask your sys-admin to fix your
name servers.

7: Lately, there's been quite a bit of talk about lharc. What do you guys
think about it?
I like it, and will and will continue to use. It uses less
disk space (which is a major concern here) and seems to extract faster
than arc or zoo. There isn't much more to say about it, other than
we like it, and we will continue to use it along with arc, zoo, and tar.Z
(One quick note, we will not support .zip. There is no known unix

sources, and thus I cannot verify the integrity of files archived in
that format. Thanks!)

There are a few files you'll really like to have:

archivers/arc602.arc : The latest version of arc
archivers/zoo.arc : The classic archive program
archivers/compress.zoo : Useful for removing .Z from sounds and binaries
archivers/unlzh11.arc : Unpacks .lzh files
archivers/sttar.arc : Removes those nasty .tar extenders
THEY ARE CONTAINED IN THE SELF EXTRACTING ARCHIVE starter.tos!!! PLEASE USE IT!

Thanks to everyone who has uploaded anything lately.....

JUST ADDED: ~atari/emulators: A directory specifically for emulators and
emulator specific utilities. Please take note of this and upload your
favorite atari/spectre/PD util.

PLEASE NOTE: FTP and BART service are a privelege, not a right! Please make
a supreme effort to keep heavy FTP and BART use in off-time hours (i.e. after
5 pm EST but before 8 am EST), especially FTP use.

Any ideas, questions, comments, etc. to me,
weiner@atari.archive.umich.edu

> again to all who send me replies!

I ounce had the same problem exactly. It turned out to be that my drive
according to speed.prg (was that it?), said that it was turning at 308
RPM. I opened the case, twiddled a bit with the speed program running,
found the SPEED POT, and turned it down to between 298 and 300. Now it's
flawless.
Hope it's the same for you, Later.

> it should also be posted, as I'm sure it's of general interest.
> Thanks,

The actual ESCAPE codes has very little to do with 'C'. Any code
can be output by placing the octal value ie. \033\001 (Escape 1 (dec))
in a message for output. What you realy need is the type od printer
you're working with (epson, laserjet) ?
To output a zero try putc('\0', PRN);

Paul Moreau.

Source record: 235259

There was a review of "Script" in STart magazine quite some time ago (sorry, I don't remember which issue).

It looked like a pretty polished product. The interface appeared very much like in Mac word processors, you know, with a ruler at the top and little rectangular icons that show differently spaced lines for selecting single or double-spacing.

The review said that it did not use GDOS fonts, but, rather, its own proprietary font format. Also, you only get one typeface, although it does come in different sizes and styles. This may have changed since the review was published, though. (Personal opinion: this font situation is getting a bit out of hand - we have Calamus fonts, Pagestream fonts, GDOS fonts, and now Script fonts. Why no standard?)

Also, you can paste graphics into your document, but the only graphics format it recognizes is that produced by "Sketch", its companion drawing program. Fortunately, there is a utility to convert Degas and .IMG format to Sketch format.

I haven't actually used Script, I'm just repeating what I remember from the review. Hope this helps.

Well, he might want to consider using it IN ADDITION to the standard
TT hard drive... The TT DOES have an ASCI/DMA port, you know. And
a SCSI port, I think (I have neither touched nor seen a TT, but
with all the "TT Information Sheets" posted over the past nn years,
I think I'm pretty safe :-)

I think that once the TT "market" develops to a point where there
will be machines sitting on shelves (without hordes in line to buy
them), there will be a case for dealers breaking up the package. But
as long as Atari & the dealers can sell the things as-is, why
bother?

>
>Is there anyone who has some idea about what might be
>happening?

I'd say it's the drive on the Mega. Perhaps it's out of alignment, or the drive speed could be off by a couple of RPMs. Rainbow TOS 'twists' the disks when it formats, to gain increased speed. I used this when I had my 1040 (TOS 1.0) using an auxiliary formatting program. You may want to try formatting the disks with a formatting program, instead of with the desktop, and see if there's any difference.

> Atari does **NOT** support ANY memory expansion for ANY Atari product before
> the TT...
>
> You buy it, and you take your chances on upgrading it...

I have heard this stated on the NET many times before,
however....

I just traded up to 1040STE, and while I was at the shop grabbed
a copy of the Atari STE sales brochure. In that document, it
clearly states that the 1040STE is "internally expandable to
4Mb". That would indicate to me that expansion to 4Meg is
supported. Atari might demand that the expansion be done by
Atari, but clearly the implication is that a 1040STE 4Meg
configuration is supported. At least that's a the way I read it
:-)

> However, the STe can be easily upgraded with SIMMs, *IF* your STe is
> equipped with SIMM sockets...

Sure was, picked up 4Meg the way home from the Atari shop. One
test of the machine at 1Meg (to see that it worked!), then an
easy upgrade to 4Meg. At as a side comment, the STE seems much
better quality than my old 1040ST.

856. TT disk, memory upgrades (was Re: TT sales)

Newsgroup: comp.sys.atari.st
Date: 1991-01-28 19:46:16 UTC
From: apratt@atari.UUCP
Message-ID: <2815@atari.UUCP>
Source record: 235344

The thread so far...

>>>If you already have a Quantum 80 or Syquest 44, you have to throw it in the
>>>trash, or sell it in "Trading Times"... forget using it in a TT...

>>Don't be ridiculous. The TT has external SCSI; you can hook up other
>>drives without any trouble.

>BUT... if you already own a Quantum 80, you CAN'T use it as your
>primary drive...

Horsefeathers! What do you mean by "primary?" SCSI device 0? You can set the SCSI device number of the internal drive to 1 and your external drive to 0 and that's that. Internal? You can unscrew Atari's drive from the TT (and toss it, if you like) and put your Quantum there.

I don't know if all this about "Atari won't sell a TT without a hard disk" is true, but even if it is, you have to look at things from Atari's perspective. Only a TINY minority of potential TT purchasers have hard drives of their own, and the cost of manufacturing and stocking another flavor of TT for these few people could be more than the cost of the hard disk (at our high-volume price) in the first place! You could end up paying MORE for your diskless TT!

This is another example of people ragging on Atari from a position of woeful ignorance. Somebody reports a rumor or speculation based on next to no data, and somebody else says, "In that case Atari is stupid/doesn't care about customers/deserves to go under." It gets tiresome.

Another part of the discussion about configurations of TT's that could use some hard data is memory: you can't buy a 2MB TT and some SIMMs and get an 8MB TT out of it. The ST RAM of a TT doesn't use SIMMs, and the TT RAM uses SIMMs, but you can only get the daughter board and memory controller from Atari. The RAM is the primary cost, of course, but the custom chip is also expensive. It would probably not pay to buy the board and controller from us with empty sockets and then buy your own RAM. It is certainly not the case that you can buy just RAM and upgrade your TT.

> itself.

This does not answer your question directly, but it may give you
some ideas.

I have much the same problem as you, I need to make 3.5inch
MS-DOS disks that can be read on Atari, HP Un*x, MS-DOS, and
maybe others. The disks get created (typically) at the Un*x
site. What I did was format a disk on MS-DOS, then made an
image copy of the disk on Unix. That is, I copied all the
sectors from the disk into a standard Un*x file (for the Un*x
heads: dd if=/dev/rfd/my_disk of=dos_image bs=512). Now, when
I want to make a dos disk on Un*x, I hard format the disk (lay
the tracks down), then image copy the dos image back to the new
floppy media (dd if=dos_image of=/dev/rfd/my_disk bs=512). It's
a bit slow, but works great. As it is possible to read, and
write the raw disk on the Atari, I see no reason that this would
not work on the Atari. Just ideas..

^^^^^^^^^^ ^^^^^^^^^^
>graphic capabilities. If this is possible please let me know ASAP.

The thought of this excites me! Imagine ST Xformer running even faster!
The 2.55 source code can be considered p/d. I uploaded the source code to
GEnie about 18 months ago and you are welcome to convert it. Had you contacted
me last year, I would have been able to help you in person, but now I must
refer you to GEnie's download library. It is not the latest source code, but
is current enough, since Xformer 2.6 is not out yet. Good luck! Please make
it TT compatible, since I live in Atari wasteland now and don't have access
to one.

859. GEM key sequences

Newsgroup: comp.sys.atari.st
Date: 1991-01-28 20:28:26 UTC
From: wright@hpcc01.HP.COM
Message-ID: <1540005@hpcc01.HP.COM>
Source record: 235348

Here is a summary of information I got from a question a few months
ago (sorry to take awhile; didn't get the feeling anybody was too
interested). Basically the question was "what key sequences does GEM
respond to?":

"Classic" GEM keys:
alt-help screen dump
esc re-read disk for active window
mouse left + shift select additional files

TOS 1.4 GEM keys:
mouse left + ctrl move instead of copy
ctrl-alt-del warm reboot
ctrl-alt-shift-del cold reboot
dbl-click+shift on back window run program with cwd == top window
(no tos1.4: cwd == back window)
click+shift toggle selection

Show file keys:
space page forward
return line forward
q exit show

I have to agree: and add that M2 is *far* better than C when you intent to
write a lot of software, because of the inherent modularity that allows you
to write a module, then ignore its detains and just USE it!

- From this description it sounds very similar to the Macro facility
- within Neodesk 3 - is it, or is it better ?

I would say, without hesitation, that Codekeys is a much better macro facility than NeoDesk 3's. Actually, NeoDesk's macros are quite lame, if you ask me. (The rest of the program is great though!!) If you want real macro capability, get Codekeys. Codekeys lets you create macros for any application -- now that I think about it, how does it work with TOS programs, where there's no DA menu? -- whereas NeoDesk's macros are just for NeoDesk and even then it's limited; the macros pause or cease operating or stop or whatever you want to call it when they encounter dialog boxes asking for mouse input or for .TTP program input.

But don't buy NeoDesk because of its macro utility. Buy it because it's a great replacement desktop. If you want macros, get Codekeys.

Yes, if you are Spectre registered user, you should have received the newsletter from
Gadgets.
There is a very detailed description in it. In case you do not have it.
What Mr. Small has said is they have tested with 33Mhz but they have not
put 50 Mhz 030 on it yet(as the newsletter written, they might have done it now
? may be not yet.) Also Mr. Small has posted a few reply last week in this group
about the SST. With 33Mhz 030 it's faster (or at least as fast as) the Mac IIci,
only the IIfx is faster than it in the Mac family.
Well, maybe Mr. Small himself can give more detail on 50Mhz 030 test.

HARDWARE:

ATARI 1040ST- 1 internal 3.5 double-sided disk drive
ATARI SC1224 MONITOR- Low/medium res. color monitor
PROMETHEUS 1200 BAUD MODEM
PANASONIC 1080i PRINTER

SOFTWARE:
ORIGINAL ATARI COMPUTER DISKS:
ATARI 1st-Word
ATARI Language disk (basic and logo)
(also contains NEOchrome -full color art and
design program)
CAD-3D 2.0
HUMAN DESIGN DISK - CAD-3d clip art and construction disk
GENESIS -The Stereo Molecular Modeler
MODULA-2- editor, linker, compiler, and user manual
I.S TALK
MICRO KITCHEN COMPANION
PHANTASIE- multiple-character role playing game
BRATACCAS- Interactive video game
DEGAS- Design & Entertainment graphic arts system

Also this package includes:
2 3.5 disk storage containers
Extra 3.5 disks
original computer boxes
all original manuals for computer and languages
computer and monitor covers
Computer desk (K-Mart Special) if you want to ship it

PRICE $900 + Any shipping charges.

Source record: 235276

How do I LaTeX (or TeX to be more accurate), the file gulam.tex that you get with the distribution archive? When I type

% tex gulam.tex

On our Mips 2000, it says that it can't find 'texinfo.tex', the first line of the file is an \include statement for that file. I would imagine that system paths are set up properly, so am I missing a file or what? Help please.

> program. He says he knows *some* of the codes, but that there are
> some he doesn't know, and he's looking for a list of some sort that
> describes them all...or something along those lines. Those of you

I apologize - he wasn't very good at explaining to me what he needed
to know:
He has an Epson FX86E printer, and knows one version of the codes,
but he doesn't know which form (hex, octal, etc) should be used in the
C program, and he doesn't know whether straight conversion from one
system to another is possible. He needs examples of source code that
show the proper programming syntax for using the escape codes, and how
exactly to convert codes, if it's needed. He says he can get some of
them to work in hex, others work in octal, some don't work in either,
and he's not sure if it's the codes that are wrong or (more likely)
the syntax he's using works with some codes and not others. Thanks again,

It's not TOS. There is nothing in the OS that can cause the behavior you describe. What *can* cause it is differences in the alignments of the heads in the disk drives on these two machines. If the heads are off in such a way that the errors increase as the head goes deeper into the disk, then you'll be able to read the first several tracks and the trouble won't start until later ("when it has become somewhat filled.").

Find a place that will re-align and calibrate your disk drives. Ask your Atari dealer for help.

[heated argument deleted...]

>jove.RC
>jovE.rC
>JoVe.Rc
>JOVE.RC
>jove.rc
>
>big deal.

You have a point, and I'll add to it. Case sensitive filenames are slower and more clumsy to type out. Only when you have filename completion in your shell ('a la gulam and unix csh), or a file selector written to show extra characters (read on) does this become moot.

However, your next point I DON'T agree with.

>And this is just a half-assed step towards a unix-like filesystem - if you >want a real unix filesystem, you gotta throw out all this TOS and MSDOS >bullshit and start FROM SCRATCH - we don't need all these tiny little steps >which make everything incompatible but look a little more like unix - give >me a break!

There is a way, using some extra bytes (I forget how many, but enough to be useful) in the directory table which are presently "reserved" (by Atari) for each filename, that could be used to put a few more characters (or other attributes) into the filenames. True, a small step, but it could be made in such a way so that it would be upwardly compatible.

It would be up to the disk driver (you'd have to write a new one) to decide how to use the extra information. You could use one or two of the bytes to provide an uppercase/lowercase bitmap for the other characters and the rest as extra filename characters, for example, just use all of them for extra filename characters, or other things (file protection bits, user id, etc...).

If you wanted to go whole hog, you could use the extra bytes as a
FAT pointer to an invisible, locked (but vanilla TOS) file containing
lots more filename information. Or to a place on the disk mapped out
so that old TOS treats it like as a bad sector...

I argue that you could make it so that it wouldn't necessarily be
incompatible with the present 8.3 case-insensitive filename system.
You could use such a disk with a normal TOS file system, just that in
a directory listing, you wouldn't see the extra attributes, and in a
file-file copy, the extra bytes (probably) would not be copied. If any
extra bytes are used for extra filename characters (e.g. 16.3 vs 8.3),
the filename would be cut off at 8. But IMHO, you would be no worse off
than before.

About the only problem this is likely to cause is if you are trying
to use two files that have the same first 8 characters (and the same 3
char extension) on the old TOS file system. The old TOS disk driver
wouldn't be able to tell the difference between them. My guess is it
will probably always choose the first of the two (unless you delete it)
in the directory table for whatever operation you're doing.

About all you'll need to see and use the nice new filenames from within
your GEM programs is a new fileselector rewritten to accomodate the
larger size of filenames (at least). Some shell programs not hardwired
to the 8.3 convention, especially if they were originally ported from Unix,
should work w/o modifications. Even the hardwired ones might only need
a few trivial changes. There are other programs that do their own
filename parsing, but in general these are not the "user-friendly"
programs anyway.

Atari itself might want to clear up just how "reserved" they presently
consider the extra bytes in the directory table. My guess is that
they won't be keen on the idea, since they've been going out of their
way to go in the other direction (down towards DOS compatibility).

Source record: 235278

I haven't done this in a while, so here goes. ;^)

Some people have been requesting Cyber/AVS animations.

14887 avsplayr.lzh - Player for AVS animations.
262467 balldemo.lzh - Spectrum 512 animation: Kanakas (that office
toy with the swinging, shiny balls.) Converted
from the Amiga.
48439 bugs.lzh - AVS anim.: Bugs Bunny eating a carrot and
saying, "What's up, Doc?"
326594 cat.lzh - AVS anim.:"The Runaway Cat." For you furry
feline fans, it's a Caterpillar tractor, not a
furball. :^)
277405 catnap.lzh - Animation for the Catnap demo. I don't have
the sound for it sorry. Please forgive me. :^)
60818 chasers.lzh - Cyber animation. Requires ANIMATE4 or similar
.SEQ viewer.
224435 circles.lzh - For those that have seen the new MegaSTe
brochure, this is the animation that they show
the screenshot of. It's quite good.
259503 deskvid.lzh - Another Spectrum 512 animation. It's a desktop
video demo.

In the next couple of days, look for:

185488 movie.lzh - A Spectrum 512 animation. This one has four
screens with different animations in each screen.
621663 mvice.lzh - AVS anim.: The Miami Vice theme played by The
Scuzz.
431295 raisins.lzh - AVS anim.: The California Raisins playing their
song.
146739 shinybub.lzh - This one's kinda old, but someone asked for it.
It's the Xanth demo with the four shiny balls
rotating. Shiny Bubbles.
62005 tecdelit.lzh - A good animation from a TV station in San Jose,
CA. Requires a .SEQ viewer like ANIMATE4.
101250 unicycle.lzh - A good Cyber animation of a unicycle playing
with a ball. Requires a .SEQ viewer like
ANIMATE4.
137853 visitor.lzh - A great animation of a UFO flying through a set
of columns. Requires a .SEQ viewer.
449702 xmas_avs.lzh - An AVS anim. for Christmas. Sorry it's a bit
late.

Here's a list of ones I recognize already at atari.archive in
\graphics, for those that didn't know they were there.

206955 3d_512.lzh - Spectrum 512 animation done with Unispec.
Requires Anispec to view.
2071 anispec.lzh - Use to view Spectrum 512 animations done with
Unispec.
395686 colawars.lzh - AVS anim.: Pepsi and Coke go at it.
308968 deja_vu.lzh - Good Cyber anim. of Fuji symbol spinning on a
scrolling platform.
155170 froggie.lzh - A cute frog being a frog. Good .SEQ animation.

874. Atari 1040ST for sale -- $400 /bo

Newsgroup: comp.sys.atari.st
Date: 1991-01-29 08:03:23 UTC
From: bgrave@ub.d.umn.edu
Message-ID: <751@ub.d.umn.edu>
Source record: 235275
Cross-posted to: comp.sys.atari.st,misc.forsale.computers

I've got an original Atari 1040 ST for sale (just the cpu).

- Original Tos in ROM
- Built-in RF modulator for use with color TV
- Computer/TV switchbox and cable so it's ready to hook
up to the TV and use.
- Internal DS/DD 3.5-in disk drive.
- Mouse
- ST Basic - manuals included

$400 or best offer. We'll discuss the shipping.

I also have Battletech - The Crecent Hawks Inception - $15.

>PostScript files. An ad in the April 1990 issue of STart lists a version
>that supports other printers, including "virtually any dot matrix" printer.
>I assume this means Epsons.

[...] It requires at least 2 Mb of
ST memory. The printer he uses is a HP Deskjet, which gives near laser
quality. I know for sure that NEC 24 needle matrix printers are supported,
and probably also Epsons.

Will you beleive me I have seen it running on 1 Meg ?

BTW: How do I get PD-fonts suitable for Ultrascript?

I recently bought a copy of Personal Pascal (second hand). I have since found out that the *.PAS files associated with PP are missing. (been erased). I particularly need AUXSUBS.PAS and GEMSUBS.PAS, could some kind soul mail then to me?

Thanks,
Jamie.

Have had a lot of problems with the PD compacters, will not Pack most files, but now I use DCSquish and have found only one program that will not run when I Squish it, funny is the DC PD Mystic Formater, I have just got the Upgrade from Double Click, this is the Version II of there DC Utilities, also has a Great Program DC Xtract 2.0 will do Zip/Zoo/Lzh and Arc, Note this program does compact as well as Extract, worth every Penny, Note I don't work for DC or any shop to do with it...

Well if the Monitors that I have touched had that sort of voltage I should have been dead many times, The Voltage in a Monitor is not that Dangerous, it only supplies about 500ua, and the Votage in a Colour monitors is about 25KV, and about 12KV in a Mono Monitor, the safe bet it to allways put one hand in your pocket, the High Votage in the monitors, is fully insulated, so there no real problem...

The Simplest way is to disable the Disk in switch, this is what I have
done with the drive in my ST 1040, the only problem is the Drives run
with no disk in them, but I find this is common with Real Atari
drives...

880. Re: Spectrum 512

Newsgroup: comp.sys.atari.st
Date: 1991-01-29 11:35:57 UTC
From: lsmichae@informatik.uni-erlangen.de
Message-ID: <1991Jan29.113557.14106@informatik.uni-erlangen.de>
Source record: 235280

avgroeni@cs.ruu.nl (Annius Groenink) writes:

> Is there someone who can give me some information about
>the way Spectrum pictures are showed? I know the file format,
>but that's not enough to write my GIF-Spectrum 4096 converter.
>I'd like to know what exactly is done with the 3 palettes
>that go with each line.
>
> Annius Groenink

Let`s have a lot a the umcompressed format:

<Spectrum umcompessed> .SPU

80 Words Scan line 0 is unused (color set to black)
15920 Words 199 Scanlines
9552 Words 199 * 3 * 16 Colors

25552 Words = 51104 Bytes

Now we one scanline and the according 3 Palettes (16 Colors each):

Color 0 of Palette 0 is the border color and set to black.
Color 0 of Palette 1 is set to black.
Color 0 of Palette 2 is set to black.

Color 15 of Palette 0 is set to black.
Color 15 of Palette 1 is set to black.
Color 15 of Palette 2 is set to black.

The other colors (0 < c < 15) are useable from left_border to right_border
(inclusive):
(All values are x-koordinates of the lowrez screen.)

left_border right_border
Palette 0:
Color c = 2*n+1 (odd): 0 10*c - 6
Color c = 2*n (even): 0 10*c - 1

Palette 1:
Color c = 2*n+1 (odd): 10*c - 5 10*c + 160 - 6
Color c = 2*n (even): 10*c 10*c + 160 - 1

Palette 2:
Color c = 2*n+1 (odd): 10*c + 160 - 6 319
Color c = 2*n (even): 10*c + 160 319

E.g. Point number 147 in the scan line has color 5. From which palette does it come from?
c = 5 (odd)

Palette 0 Palette 1 Palette 2
0 .. 10*5-6 = 44 45 .. 204 205 .. 319

=> This is a color from palette 1.

BTW I would be interested in your gif shower. Please post it when ready.

"May the Schwartz be with you!"

>Some people say we can use 2 x 1Meg SIMMS and 2 x 256K SIMMS to make
>a 2.5 Meg STE system.
>
>Is it actually reliable and supported by ATARI ?

Atari has a policy of not supporting anything that they don't produce.
ie. 2,2.5 or 4Mb STEs are not for sale therefore if they don't work
you needn't bother asking them about it.

The mixing of SIMMS to get 2.5Mb is screwed up by a bug in TOS 1.6. The ROM
code that sizes up memory assumes that both banks are the same size. I don't
know if this is fixed in TOS 1.62. Would Atari care to comment on that?
Anyway the patch is to put a program in you auto folder that checks the
memory configuration and if it's not 2.5Mb make it so, set phystop to
$2800000 and reset by jumping through $4.

It seems that this policy also extends to hard disks. Atari UK apparently
do not entertain STE hard disk problems unless the HD is an Atari one.
While this is sort of understandable they should at least help the HD
manufacturers to get it right if it's their fault. I believe long DMA cables
(>18") contribute to the problem. I'd really like to know if new STEs have
this problem resolved because I can see it hurting serious ST sales.

885. AT Speed & Protected Mode

Newsgroup: comp.sys.atari.st
Date: 1991-01-29 12:22:55 UTC
From: alanh@logitek.co.uk
Message-ID: <alanh.665151775@krypton>
Source record: 235169

Remember AT Speed & Protected Mode.

Well, it looks as though I have found the problem.

In the AT Speed manuals, it says it supports BIOS functions 87HEX and 88HEX via the INT15 call, These calls relate to shifting blocks of memory especially into extended (i.e. above 1 Meg). To switch the processor into protected mode the function call 89HEX is made via INT15 again. This in turn crashes AT Speed.

With 87HEX and 88HEX it does not switch the 286 into protected mode, but passes some code onto the 68000 to shift the block of memory, rather than get the 286 to do it.

This is also why windows 3 works because it only uses calls 87 and 88.

So, any program out there which works under DOS and switches the processor into protected mode via function call 89HEX will crash, subsequently OS/2 and XENIX will not function either.

Therefore the features of AT Speed over PC Speed, that I can only see is the Speed increase from 4.4 to 6.7(Norton Factor).

CAN ANYBODY FIX THIS ??????????

Thanks.

Uhhh, no. I tried to run it once on a Mega 1, and it pops up an error noting that there is insufficient memory. What version of US did you use, what printer and what resolution?

Maybe I used an old version, and did IMAGEN some work to reduce memory usage.

Anxious to know more....

>for flex?)

The bison binaries which have been out for a couple of years choke on the
CR character which most atari programs insert before LF after every
line of a file :-(. Strip out the CRs, and it should not bomb.

Yes, I want to put out my new port of bison, but I cannot get it to unlink
its temporary files correctly. In the mean time, use byacc, in
atari/gnustuff/tos at atari.archive.umich.edu. It works fine.

You must learn to do a leap across, catch with your hands and pull
yourself up. To do this you use the shift key on the IBM's or Amiga key
on the AMIGA (dunno for Atari). STand on the edge facing rightward,
press the shift and simultaneously do a standing leap. Pull yourself up
by releasing the up key (I think---its either that or the sideways
arrow). You need to practise this anyway because if you cant do this
now then you'll never get through level 3. You cant save until level 3
so practise 3 by using shift L until you cant get through 3 ok. Level 4
is easier.

well level 7 is next but you need three more Ra keys apart from the
one you already have (from level 3) inorder to get the firestaff. The
next ra key is in level 9 with the bastard rats in it. You should
be able to do 6 level fireballs by now. I have one double master
wizard at level 9.

[boy oh boy. ask a simple question and i get STOMPED LIKE A GRAPE!!!]

In article <1709@lee.SEAS.UCLA.EDU> plinio@turing.seas.ucla.edu (Plinio Barbeito/;093091;allsites) writes:
>[heated argument deleted...]
>
>You have a point, and I'll add to it. Case sensitive filenames are
>slower and more clumsy to type out. Only when you have filename completion

oh, pu-lease! now you guys are telling me because you are perhaps not a good typist, i should not have the option of using MY OWN shift key. sheesh, why can't u understand the fundamentals of this question: I WANT TO BE ABLE TO TOGGLE THIS BEHAVIOR. it need not affect u one bit. i already outline a reasonable method for implementing it, thought up in a fit of creativity in like one minute. and if i can figure it out, anybody can, though i seem to be a better typist than some :-).

believe me, i'd much rather have 256 char file names, but that is infinitely more difficult than what i am talking about here, which just requires REMOVING code from TOS, not implementing a whole new file system.

look, do u realize what i am talking about is removing an amount of code that resembles this:

```
for ( ; *ps; ps++)
if (islower (*ps))
*ps = toupper ((int) *ps;
```

nothing fancy-shmancy, just that. all i want is a system call and a global internal variable and for these 3 lines to be implemented:

```
/* this code in TOS */
if (global_var_telling_if_we_want_force_upper_case == TRUE)
{
for ( ; *ps; ps++)
if (islower (*ps))
*ps = toupper ((int) *ps;
}
```

and have a system call:

```
int Fcase (what)
int what;
{
extern int global_var_telling_if_we_want_force_upper_case;
int ret;
```

```
switch (what)
{
case INQUIRE:
return(global_var_telling_if_we_want_force_upper_case);
case SET:
ret = global_var_telling_if_we_want_force_upper_case;
global_var_telling_if_we_want_force_upper_case=TRUE;
return(ret);
case UNSET:
ret = global_var_telling_if_we_want_force_upper_case;
global_var_telling_if_we_want_force_upper_case=FALSE;
return(ret);
}
}
```

now is that too much to ask?

how can having an option to either use it or not be worse than not having the option in the first place? that's why your keyboard has a caps lock key. how is owning a ferrari and a 4x4 worse than owning just a 4x4 (or just a ferrari, assuming u can afford both, etc)?

ok. lets drop this. it is getting far too silly for me...

Imagen did release two versions, the first version of UltraScript
was mainly intended for the SLM804 Laser Printer and required
2 Meg, they later came out with a version called UltraScript ST1,
or something like that, which worked one 1 Meg machines with all
the different printers supported...at least that is the way that
I was told and read.

Here's a note from Hans in response to an earlier query...

> Sozobon Questions:
>
> Is Sozobon still under development?

Yes, very slowly.
> Has it been ported to Minix, PC or the Amiga yet?

It has been ported to Minix, and the result offered to
Andy Tannenbaum, but he wasnt interested. It really needs someone to do
a lot of support (not us!).
There are several unofficial ports to the amiga. The problem here
is that Commodore insists on restricting the header files. Without the
header files the compiler is useless. We are not going to waste our time
unless their attitude changes.
The PC is a bitch. 2 people have started ports and given up.
> Just what is it's current status?
Works well under a TOS shell. Does not work under MINT.
Comes with cc,hcc,jas,ld,make,ar,size,assembly level debugger,
libc, gem library, new floating library, stevie.
You probably will want to pick up a shell like Gulam to use with it.
(Dont use shells that upcase args).
Does not come with extensive documentation, support, etc.

You can always get the latest full TOS release by sending
$10 ($12 from overseas) made out to 'Tony Andrews' to

Tony Andrews
4704 Berkshire Court
Boulder, Colorado 80301
USA

However, do not send us questions without also sending a STAMPED
self-addressed envelope (if you want an answer).

> files with only a header). As a result I can't fix the bugs.
Top 1.2 was released with a bug which made it produce a bad 'jas'. A fix
was posted later. If you need the latest fixed release, see above.
Unfortunately, most bulletin boards and archive sites have NOT put in the
fixes.

No kidding! Why are people so impatient? I realize Atari has given people
a lot of grief about expansion and other assorted things, but people are
assuming too much before things make it to market based on some rumor that
nobody really knows is true yet!!!

On the other hand, if there is discussion in places like this where people like
you at Atari can see what people are/aren't satisfied with (real gripes, not
just whining just to hear oneself whine), it may valid to voice such things.

I do, however, side with you on this one.

>From this description it sounds very similar to the Macro facility within
>Neodesk 3 - is it, or is it better ?

I have been using Neodesk 3 for quite some time now, but I have one
complaint about it:
The Macro Facility is very badly documented, and I can't get it to do
what I want....

All I need is a macro which runs the first accessory on the desktop.
I go through the motions, save the macro, and then try to run it.
I see a little M on the upper corner of my screen, and nothing happens.

has anyone managed to get it to do something like this?

895. Robert Arp "Atari ST Machine Specific Programming In Assembly"

Newsgroup: comp.sys.atari.st
Date: 1991-01-29 16:49:15 UTC
From: gaudreau@juggler.East.Sun.COM
Message-ID: <4093@eastapps.East.Sun.COM>
Source record: 235297

I don't know if anyone is aware but Robert Arp wrote a really good manuscript for programming the ST in assembly language (hundreds and hundreds of pages. It never got published :-(but he has uploaded the text and src of the book to many bulletin boards, etc. What I noticed is that it isn't on atari.archive. I've gotten his permission so sometime this weekend I'll correct that little oversight. Hopefully, someone can find good information there!

Cheers,

Joe

896. Gulam questions

Newsgroup: comp.sys.atari.st
Date: 1991-01-29 16:55:34 UTC
From: gaudreau@juggler.East.Sun.COM
Message-ID: <4094@eastapps.East.Sun.COM>
Source record: 235298

I ran across something weird with Gulam that I'd like to know more about. Here's the situ: I uuencoded a ST binary and split the resulting file into three pieces. Copied those to ms-dos format floppies and brought them home to my Mega/STe. Copies the files onto the HD and ran Gulam so I could 'cat' them together. Right? Wrong. Not. I also tried 'cat filename' and nothing was shown on the screen. Hmmm. 'ue' loads and modifies the files just fine. 'cat' still won't show the file. Created a new file with 'ue' and that does 'cat' properly. What's going on? Hints? Ideas?

Also, atari.archive has Gulam 1.03.04.05 12/18/87. Is that the last version known? Is src available? Seems like a really nice shell and it would be a shame to see it perish.

Thanx.

Joe

In Canada the following are currently available:

1040STE 1Mb/68000-8mz/720k floppy/4096 colours -- $695.00

MEGASTE4 4Mb/68000-16mz/720k floppy/4096 colours
48mbHD -- $2,495.00

MEGASTE1 1MB/68000-16Mz/720k floppy/4096 colours
monochrome monitor -- $1,295.00

TT030/4/40 4Mb/68030-32Mz/720k floppy/48mbHD -- $4,295.00

Note: The MEGASTEs have a 16Mz 68000, come in the same box as the
TT. They have the following builtin:
- 1 Parallel port
- 4 Serial ports
- 1 Mouse
- 2 Joystick
- 1SCSI
- 1 ACSI
- Local talk
- cartridge
- MIDI in
- MIDI out
- 68881 math co-processor
- 1 Internal A24/D16 VME expansion slot

Monitors:

SM124 - Monochrome for ST 640x400 -- $249
SC1435 - 14 inch "STEREO" colour monitor for ST's -- $595
TTM194 - 19 inch Mono Hi-res 1280x960 for TTs -- $1,495
PTC1426 - 14 inch Multi-sync colour 640x480 for TTs -- $879

All prices mentioned are suggest retail prices in Canadian funds.

It appears that most of you out there are not particularly interested in buying a complete system, but rather parts.

So, looks like I am now accepting offers on the hardware pieces rather than the system as a whole.

Please Email your offer directly to me. I still have the complete system although I have offers for most pieces.

Thanks again,

Marshall

There is a bug in the NEO 2.x version having to do with memory management and
the way that NEO does a multi-file copy -- NEO uses all available memory to
read as many files into memory that will fit, and then copies them all out to
the destination, then refills the buffer. In some cases (I don't
remember which)
it does this wrong, which then results in corruption of either the data in some
of the files, or of the file names and directories. I found this out by
hitting
the bug, then calling Gribnif. The solution I used was to do all copies through
Universal Item Selector, called through the acc at the NEO desktop.

NEO 3 appears to not have this bug.

=jerry@TALOS.UUCP (Jerry Gitomer) writes:
=In Canada the following are currently available:
= MEGASTE4 4Mb/68000-16mz/720k floppy/4096 colours
= 48mbHD -- $2,495.00

The US model has these differences:
= TT030/4/40 4Mb/68030-32Mz/720k floppy/48mbHD -- $4,295.00
=
= Note: The MEGASTEs have a 16Mz 68000, come in the same box as the
= TT. They have the following builtin:
= - 1 Parallel port
= - 4 Serial ports
Two of those serial lines (LAN and Serial2) are actually the same output
device and can't be used at the same time. Still THREE serial lines. What
do I do with them...
= - 1 Mouse
= - 2 Joystick
Just one - like a regular ST.
= - 1SCSI
None. That's the TT.
= - 1 ACSI
= - Local talk
See above.
= - cartridge
= - MIDI in
= - MIDI out
= - 68881 math co-processor
yikes - I *hope* US model has one of these!
= - 1 Internal A24/D16 VME expansion slot

On another note, I have a Mega-4/Ste and would love to know if I have
a floating point chip without opening the case (I'm chicken for the next
three months :-). Is there an available software test?

= SC1435 - 14 inch "STEREO" colour monitor for ST's -- $595
These are really nice. The Stereo is quite nifty although I get better
sound from a "boom-box", which is to be expected.

I have replied to a number of posts regarding monochrome monitor problems in the past week or so, and had offered to send a text file describing how to adjust them, unfortunately my home system is down indefinitely so I won't be able to do that. However the file is availible on CompuServe, the file name is MONOMON.MOD (I think), so if someone were willing to repost it here there are some disgruntalled MONO owners that would appreciate it.

This is file is a must for anyone that has more than half an inch of black showing arround the edge of there monitor.

> monochrome monitor -- $1,295.00

We still can't get them in the U.S.!!!! Even though they have apparently
passed Class B.

> Note: The MEGASTEs have a 16Mz 68000, come in the same box as the
> TT. They have the following builtin:
> - 1 Parallel port

I thought the MegaSTe had only 2 serial ports, while the TT had all four.
If you have actually seen them, please forgive me.

I would agree that it is highly likely that the mega2 drive is out
to lunch. On my mega2, I could not get a reliable backup of my HD
onto floppies. The symptoms were "bad" spots on floppies that
moved tracks, disks that were readable then ureadable and then
readable again without any changes to the system. When I got an
external FD, all my floppy problems "went away" as long as I stick to
the B: drive.

Go home, chuckie.

If you haven't tried DM, you're missing out on one of the premier applications ever developed for the ST.

Besides, comp.sys.atari.st is for everyone. Even people who don't know how to write.

I'll bet you think Flight Simulator II is just a game, too.

This coming from a guy who doesn't even capitalize the first word of his sentences :-?

> how can having an option to either use it or not be worse than not having
> the option in the first place? that's why your keyboard has a caps lock
> key. how is owning a ferrari and a 4x4 worse than owning just a 4x4 (or
> just a ferrari, assuming u can afford both, etc)?

Well, some applications, upon finding the feature, might insist on using it, and not leaving it up to the user. Someone might write an application that creates internal data files named "foo" and "FoO" and requires them to be distinct.

Realistically, this can probably be avoided, but the point is, it is not a given that people will be able turn the feature off just because it is made optional.

Using the car example, if all there were in the world were ferrari's, then your boss could not expect you to drive through swamps. If the option to own a 4x4 became available, it is possible that your boss will be require you to drive through a swamp.

In this list, games have been rated on a scale of 1 to 10, 10 being the best and 1 being the worst. For each game, the total number of votes, the average rating, and the vote distribution are shown. New games are indicated by a "*" before their entry. If a "(C)" appears after the title it means that the game is a CD-ROM or disc system title. If a "(J)" appears after the title it means that the game is currently only available in Japan.

The general guideline for ratings is:

8-10 worth buying at full price
6-7 worth buying at a discount, or if you're particularly interested in this kind of game
3-5 only worth renting
2 only worth playing for free, and only for a few minutes
1 worthless

The vote distribution uses a single character to represent the percentage of votes for each ranking. The following character codes can appear:

"." no votes cast "3" 30-39% of the votes "7" 70-79% of the votes
"0" 1-9% of the votes "4" 40-49% of the votes "8" 80-89% of the votes
"1" 10-19% of the votes "5" 50-59% of the votes "9" 90-99% of the votes
"2" 20-29% of the votes "6" 60-69% of the votes "*" 100% of the votes

Please consult the article entitled "ABOUT THE VIDEO GAME RATINGS REPORT" in the newsgroup rec.games.video for more details, including information on how to vote.

Questions, comments, problems, and errors should be directed to the list maintainer at either of the below addresses:

For sale:

Atari 520ST CPU. This is *NOT* a 520STFM. 1MB RAM upgrade, no RF
modulator. TOS 1.0 ROMS. Includes mouse and extra Yamaha chip.
Perfect working condition.

This includes the CPU only, no disk drive or monitor. You could buy
it as a backup unit.

Asking $175 or best offer. Price includes shipping within the
48 states. Computer does come in original packaging.

If interested, reply via one of the below mothods.

tari people,

There is a review of the STacy in this mos/ issue of electronic musician and it's not very positive. One thing it did say was Atari software got a D grade (that is GEM, not apps) one complaint the reviewer had was that GEM required a 1/2 to 1 second pause before an initial click in a click-drag manipulation otherwise the drag would fail. Is this a problem I'm not aware of? I have a Mega & a 520 & they seem OK. If their reviewer is indeed seeing things that are ;not there perhaps everyone can write a letter to the magazine.

Sorry I couldn't quote the magazine directly.

This is a bug in TOS 1.0 and TOS 1.2. It's fixed in TOS 1.4 onwards. You will also find that a write protected program will not get run if it's hidden. That's fixed too.

>`None. That's the TT.

I'm pretty sure the internal harddrive on the STe is an imbedded
SCSI drive plugged directly to the computer, so there is scsi there.
Whether it was brought out the back of the computer or not, sorry, I
didn't look. Ilike the concept behind the Mega STe1. It's basically
a dealer configuable box, as the cost on 256k simms appearantly is
about 3.00$. Now if someone could come out with a board which used
a bunch of 256k simms to make a 4 meg board that fit the 4 simm
slots, there'd be a use for all those excess simms.......

Someone mentioned here that the 2.5 meg configuration didn't
work due to a bug in tos 1.6. If what I've heard is correct, this
is wrong. The new mmu is part of a larger chip with other custom chips
incorperated into it. I'd say the logic to support the 2.5 meg config
was left out to simplify design, rather than from malice.

>
>Actually, the Mega STE _does_ have the Localtalk port. It's labeled "LAN"
>

A friend of mine is looking for an X Terminal package which supports
the rs232 port on the ST and doesn't have to be purchased with a lan
board of any sort. Does anyone know of a company that supplys this?
I was looking through a book on programming for X, and it seems that
the primitives look a lot like VDI calls. An interesting project would
be an X terminal package that mapped the X communications to a Gem window.

>they seem OK. If their reviewer is indeed seeing things that are
>;not there perhaps everyone can write a letter to the magazine.
>
>Sorry I couldn't quote the magazine directly.

What the reviewer was probably referring to (without realising it) is the way GEM handles a double-click. The first time you click the mouse, GEM waits a preset period of time (as set in the mouse double-click speed, in the control panel) to decide whether you will make a double-click. If you haven't pressed the button again within the time frame, a single-click event is posted - if you have, it is posted as a double-click. This is quite different to the way the Mac OS (for instance) handles a double click. With the Mac, a click posts a select event immediately. If a second click is made within the double-click period, a second, double click event is posted.

If you set the double-click speed of both the Mac and the Atari real slow, you can actually see that the Mac gives visual feedback immediately after the first click of a double-click (eg., an icon changes its visual appearance) whereas the Atari waits until after the second click to give visual feedback.

If the magazine reviewer had set the double-click speed to the slowest setting, he (she?) would have observed the delay you mention, ie. a delay after holding the mouse down before a drag could take place.

It is interesting - this single technique alone causes a large difference in feel between GEM and the Mac OS, and makes GEM seem "sluggish". Perhaps if a patch could be made to GEM to allow a single click to be posted immediately one occurs, with a second post (as a double-click) if another click was observed on the same pixel within the time period, then GEM would feel faster (or smoother). But then again... who knows what other programs would break!

If you were coding your own application, it would not be too hard using the normal AES calls to simulate the Macintosh approach.

Hope that helps!

> stop this stuff you are cluttering this area with game junk!!!

Although I work at the same university as John Upham, I don't know him,
so there's nothing personal here.

Why should 'game junk' be excluded from this newsgroup? As I understand
it, the area is for all kinds of ST-related discussion except perhaps
for the recently hived-off 'tech' area.

I don't play Dungeon Master, so I tend to skip over messages about it.
I can appreciate that people who have to pay directly to read news might
find messages about topics which don't interest them irritating, but I
don't think we should deliberately narrow the range of discussion.

if push came to shove i would also defend chucks atari revolution
lowercase punctuationless contributions as long as they are balanced by the
occasional leavening of chris mauritz cynicism ok folks i think ive said
enough for now

Cheers,

Graham

From: adp@csug.cs.reading.ac.uk
Message-ID: <1991Jan30.115753.20479@csug.rdg.ac.uk>
Source record: 235113
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

(Sorry if this is a repost - Trouble locally with rn/pnews)

Hello,
I would like to use the mouse in a TOS program, ie to be able to get the x and y coordinate of the mouse and the state of the two buttons. I have seen the 'xbios #0 initmous' call that sets up (among other things) an address of a routine to handle the mouse input. What I would like to know is how to program this routine, ie how to read the mouse packets. (Also how to reset the mouse to its previous state on program exit). Any help would be appreciated.

Also, please could someone recommend a good book on the 'internal workings' of the ST, such as the low-level stuff like the above, keyboard reading, detailed description of linea, etc. I have the book "Concise Atari ST 68000 Programmers Reference Guide" which contains many things, but not always very accurately or to great detail.

Thanks,
Andrew

I disagree. Dungeon Master is a great game, and has probably sold many ST's.
This is a personal computer newsgroup, and folks play games on personal
computers! If you are interested in purely technical discussion, read
comp.sys.atari.st.tech.

Remember this bit of stupidity as I answer Bob's questions below...

> Why would Atari design the TT with memory "daughterboards" you can only
> obtain from Atari otherwise..?

Probably the same reason that Apple designed the Macintosh so that it was not 'upgradeable' except through hardware hacks. Know how much it cost to convert a 128K Mac to a 512K Mac? $900. Know how much it cost to convert a 512K Mac to a 1 Meg Mac? $900. Business practices appear to indicate that Atari is following the well-trod path of Apple at this point in time.

> Why would Atari insist on selling you the hard drive THEY want to sell?

Probably the same reason that Apple insisted on selling you the hard drive THEY wanted to sell -- until someone found a way to do things differently, and Apple made enough money in market share to give up the hard-drive business.

> Just another example of how Atari Corp will always remain a backwater
> "other" computer company.

Like Apple Computer Corp.

Sigh... Bob, why don't you go buy a Macintosh and plage someplace like comp.sys.mac? Your blood pressure would sure enjoy the change of place. You're recent posts have been pretty apoplectic.

|In article <1885@quando.quantum.de> elliott@quando.UUCP (C. David Elliott) writes:
|>
|>If you have a look at some public domain software and read the documentation
|>files and such like, you will usually see the author saying something like
|>
|>>> This program is public domain and should not be sold for profit.
|>
|>To me this means pretty clearly that public domain software shouldn't be sold
|>to make a profit (and if you buy any at profit making-prices perhaps you
|>should look around a bit better first because - at least in the UK and
|>Germany - many PD libraries exist which are run as non-profit making
|>organisations).
Really? If you mean the - most often academic - sites which act as ftp or
mail servers that's true. But a look at those ST related mags (at least
here in Germany) implies that there's a really big market for PD. I guess
many ST users don't know another way to get this software and so they pay
8 to 10 times the price of an empty disk (without shipping). This seems a
bit more than the costs for copying. Some authors are aware of this fact
and explicitly forbid this kind of distribution. Well done.
Are there any other ways? Perhaps user clubs? How is this done in other
countries?

|As soon as an author says a program is public domain, he loses all control over
|it. The phrase "should not be sold for profit" is just the author's opinion
|and carries no legal force. Whether it carries any moral force is up to the
|individual. If someone wants to sell a public domain program, that's between
|him and the buyer, and there's no legal reason he can't do it.

|If you really want to insure that a program can't be sold for profit, keep the
|copyright. Then you can place as many or as few restrictions as you want on
|it's distribution, including prohibiting sale for profit.
I agree. Moreover, I think real PD software hardly exists. Most authors
keep the copyright or declare their programs as 'freeware' or even
'shareware'. Btw., does naming them so carry any legal force (without
mentioning the copyright)?

Source record: 235195

(Joe Gaudreau - Sun BOS Software) writes about gulam and cat.

I don't think that 'cat' is straightforward under TOS. I was warned that 'cat' in gulam doesn't work as expected. Someone on the net supplied 'filecat', a utility which *does* perform file concatenation. You should be able to pick it up on atari.archive.

I tried compiling up the GNU file utility 'cat' to see if I could get round the problem that way. It compiled up OK, but running it results in OS errors (sigh).

I believe the author of gulam is no longer working with STs.

When dealing with high voltage equipment the potential for shock IS REAL.

But there are some very high voltage capacitors that store a whole hell of
a lot of charge. Enough so to knock you flat on your arse. Before you
stick you hand in a monitor ground those caps to bleed off that charge.
This is assuming you are working on an unpluged monitor.

If it is not unpluged then don't open it up unless you know what the hell
you are doing.

Bob_BobR_Retelle@cup.portal.com writes:

:Allan Pratt wrote a message pretty much spelling out how Atari Corp plans
:to try to lock their customers into buying what Atari Corp wants to sell
:them, NOT what the customers may want...

If Atari, or anyone else, ignores what their customers want they will wind
up going out of business. The TT, the Portfolio, and the new 16-bit game
machines indicate that Atari =isn't= going out of business. Ergo, Atari
is selling what the customers want, although perhaps this does not
coincide with what =you= (or I) might want.

:It's really too bad that Atari Corp, as a third-rate computer company can't
:learn to accomodate their customers as their competition does. Apple and
:IBM Corp don't force you into buying what *they* want to sell you. They'll
:sell you the system you want, and allow you to upgrade it as you want.

You have obviously not looked at either a MAC Classic or a PS/1.

:Why would Atari design the TT with memory "daughterboards" you can only
:obtain from Atari otherwise..?

Atari will not, and cannot, stop you or anyone else from going into
business making and sellng daughterboards that replace those Atari
sells for the TT.

:Why would Atari insist on selling you the hard drive THEY want to sell?

Perhaps they want to minimize cost for the typical purchaser, perhaps they
want to maximize profit, perhaps they just want to make sure that the TT
users have a hard disk that is "performance tuned" to the processor.

:Just another example of how Atari Corp will always remain a backwater
:"other" computer company.

I don't agree, but to each his own opinion.

Yes, 0.7 is the current version.

> Specifically:
> What is wrong with 0.6?

Several bugs (e.g. in memory management) and inefficient code (again, mostly
in memory management).

> Is there a reason (?bugs etc.) why 0.7 hasn't been posted?

No reason in particular; it just didn't seem like a big enough change to
post, and most people have access to atari.archive or some similar site.
There is a major bug in the new 0.7 code for handling minix filesystems,
so that's another reason not to post (Steve Henson has found and fixed the
bug for 0.8).

I'll post 0.8 when it's ready (don't expect it real soon).

Question:
Not mentioned in the specs for he MEGA/STE are the new anolog 15 pin ports. I suspect they have been droppped then as worthless because the MEGA/STE doesn't have them. I mean what point is there to upgrading the ST if the new ports you put onto it aren't carried over into the higher end models???

937. 68030 SST to STE, can it be done?

Newsgroup: comp.sys.atari.st
Date: 1991-01-30 17:04:46 UTC
From: s37837k@saha.hut.fi
Message-ID: <1991Jan30.170446.5940@santra.uucp>
Source record: 235192

Is it possible to install the 68030 SST to STE? I know that there are
adapters that make this physically possible, but does it work?
Where can I get such an adapter? (PLCC to DIL)

Please followup this article, because I may not be the only one needing
this article.

>respond to?":
>
>"Classic" GEM keys:
> alt-help screen dump
> esc re-read disk for active window
> mouse left + shift select additional files
>
I thought everybody knew about the left mouse button:
Left mouse hold+ right mouse select things in inactive window
(Shift works here, too I think)
Left mouse hold+ right mouse dbl clk launch from inactive window

And even neater is the "mouse program trick"
Double click an executable, then either hold the mouse button down or
push the mouse up to the GEM menu bar and let go. The program won't
start until you let go of the mouse button or move the mouse from
the menu bar.

If you've seen this, is there an abort sequence, i.e. OOOPS?
I've looked for about a year, ALT-this-that-or-the-other, CNTRL-(same)
Space, etc, double click, you name it. Maybe there isn't one, but
it sure would be nice

Source record: 235194

In article <5050688@zebedee.uucp> zebedee.geoffc@tharr.uucp writes:
>Does anyone have a program that will compress a TOS directory so that all
>the directory entries for the files lie at the start of the directory ?
>I know that the reorder option of Neodesk 3 does this but I would like a
>program I can use from a CLI to do the same job (to cut down on having to
>quit back to Neodesk).

i am not exactly sure what u mean, but consider this:

```
find mydir -type d -print >xxx
find mydir -type f -print >>xxx
zoo aI archive <xxx
```

i am not sure of the zoo options. this is known to work on unix. zoo,
nice program it is, allows u to read the list of files from stdin (can
lharc do this?). the first find program lists all directories starting
in mydir, the next one lists files. so you get a list which may look like:

```
mydir dir
mydir/mgif dir
mydir/tmp dir
mydir/edit dir
mydir/mgif/Makefile file
mydir/mgif/README .
mydir/tmp/font-36x80 .
mydir/tmp/font-8x9 .
mydir/tmp/font-hack
mydir/edit/elvis.zoo
mydir/edit/emacs-readme.jrd
mydir/edit/emacs39.lzh
mydir/edit/emcs1855.0
mydir/edit/emcs1855.1
mydir/edit/emcs1855.2
```

is this what u mean? all the directories are first in the list. note that
i don't think that this can be put in a gulam script, because (at least
the version i have) does not handle redirection from inside a script. other
shells can do this, however.

i think there is an st find(1). i have my own (of course).

>
> I'm wanting to add a tape backup system to my ICD Host Adapter based
> SCSI hard disk system. Does anyone know what kind (brand name/ model no.)
> of SCSI tape drive ICD sells in their FaST Backup setup?

The tape drive ICD uses is the TEAC MT-2ST/N50 streaming cassette unit, available in single-quantity prices around $400. But I wouldn't rush out to buy one just yet. As someone else here mentioned, ICD uses a custom ROM in the units it ships, which at the very least has a special device ID that its backup software queries for, and that off-the-shelf TEAC drives do not have. Also, ICD does not sell their backup software separately, so you'd have to write your own.

It's my understanding that ICD plans to unbundle their FaST tape backup package sometime during the 1st quarter of '91, probably to coincide with the release of the new 2.0 version of their backup software.

> I'm interested in one
> but I want a reputable mechanism as it will see daily use. ICD doesn't
> seem to know (or care to disclose) the mechanism they use so I'm worried that
> it may be a cheapo unit....

The TEAC drive is definitely NOT a "cheapo unit" and should stand up to daily use for years. This is the same drive that's in widespread use on both Macs and PCs, and has received excellent reviews for drives in its class (150 megs, 6-7 megs/minute).

I've been very happy with the one I've had here at work for about a year. I'm not diligent enough to back up every day, but at twice a week I've never had a glitch. The tapes are rated at 1,000-2,000 passes, which translates into 10-20 years at my frequency. Plus, I rotate three tapes, which gives me some backup redundency and extends things even further.

They really are extraordinarily fast, averaging 6+ megs/minute in real-life use. Their only serious limitation is that the current backup software is totally sequential. This means that if you back up, for example, 60 megs onto a tape, when you come back later to restore one small file located at the end, it takes 10 minutes to scan for EOT. The same thing is true if you want to append save sets onto one tape. I have no idea if the v2.0 software will alleviate this situation.

Dave Small and Charles Johnson seem to like their ICD tape backups a lot, and I have no serious complaints about mine (I just don't append save sets, which means I "waste" large chunks of 150 meg tapes). The

packages go for ~$770-780 at places like Joppa, Micro-Tyme, and Toad. Which isn't a bad price for an assembled: drive, host adapter, power supply, enclosure, backup software, cable, and one tape. Especially if you then amortize that cost by dropping in a 3.5" hard drive in the same box, as I did. Tapes run $25-35, depending on where you get them. Plan on buying at least one or two extra tapes (I have about a dozen tapes, but this is for a business, and some are kept off-site).

[One additional proviso just occurred to me. Most hard drives these days have transfer rates in the 500+ kB/sec range. But if you happen to have an older drive that runs < ~300 kB/sec (my old 20-meg Mini-Scribe clocked in around 200 kB/sec), the FaST tape backup isn't fast any more. I.e., things slow WAY down. The reason is that the hard drive can't keep up with the SCSI tape, so the tape has to stop, turn around, back up, then get back up to speed and resync before writing again. This happens over and over again. I wouldn't recommend the FaST unit for drives in this category.]

Source record: 235196

In article <7340070@hpfcso.HP.COM> mjs@hpfcso.HP.COM (Marc Sabatella) writes:
>This coming from a guy who doesn't even capitalize the first word of his
>sentences :-?

hey, it made e. e. cummings a star :-)

>Well, some applications, upon finding the feature, might insist on using it,
>and not leaving it up to the user. Someone might write an application that
>creates internal data files named "foo" and "FoO" and requires them to be
>distinct.

No. A well written application will test the tos version and bypass this.
a poorly written application will not, but then these are not even guaranteed
to run on any os other than what it was developed on (i.e. "undocumented"
variables, locations, etc which apratt wisely warns us about). so why
even bother keeping the guys who write lousy code in business by buying
their products? i am sure DC/Beckmeyer/et al would not be around if they
were not careful, and did not write good code. let the market decide.

>Realistically, this can probably be avoided, but the point is, it is not a
>given that people will be able turn the feature off just because it is made
>optional.

People WILL be able to turn it on/off. right from the desktop or with a 10
line (trivial) application. the system can be booted with feature disabled.
the only thing i can think of which may break is if the state is saved to
DESKTOP.INF and u try using the new version .inf on an older tos. this may
be analogous to the blitter state. what happens in that case? will tos 1.0
die when reading a tos 1.2 .inf, if the blitter state is saved in the file?

it sounds like u think that adding new features to an OS is bad, since
new applications which use them will not run on older systems (unless
they are well written - see above). so why even bother upgrading an OS?
and u can get TOS upgrades (i.e. Rainbow TOS). infact, why even bother
getting new equipment 20 years from now? today's software won't run on
it in all likelihood. and what about things like MiNT, a really nice
piece of work. MiNT applications will not run without MiNT (essentially
an OS upgrade). the only difference here is that MiNT does not cost
anything. a bona fide TOS upgrade may cost $100, if that.

note that i realize that a disk saved with mixed case file names may be
impossible to read on an older TOS. in that case, it should be up to the
purveyor of the disk to decide how it should be written. if it is
commercial s/w, then it is marketing decision. many, many programs do
not run on 520s. that does not make them bad programs. it just means that
for people to use them, they must have the correct hardware/OS. and people

buy (or at least should, in most cases) computers because of the software they want to use.

i REALLY don't want to talk about this anymore. i know it is 1) feasible, 2) won't really break anything (at least i have not heard any convincing arguments), so the point is now moot and really up to atari.

Cumpu-seller West, in St Charles, IL, has offered the MEGASTE4 for sale from stock. The company is an interesting case, by the way. They are the direct successor to Computer Cellar, which went out of business largely because the PC software business was too cutthroat, but partly because of the bad state of the new ST hardware business. I have no Idea whether any Mega Es are left in stock.

>
> I'm not interested in breaking up the system at this time.
>

OK, I've received a few responses that lead me to believe this stuff will
all sell, but not all to one person, SO...

I will break up the system, but only if all the parts sell. Here is the
individual price list. (None of these prices include shipping).

STe (4MB) $450
Megafile 60 $450
SM124 mono monitor $100
SC1224 color monitor $150

The monitor switch goes to the first person to claim one of the monitors.

The price for the complete system is still $1000 plus shipping.

947. umoria 5.2.2

Newsgroup: comp.sys.atari.st
Date: 1991-01-30 20:54:03 UTC
From: saj@chinet.chi.il.us
Message-ID: <1991Jan30.205403.911@chinet.chi.il.us>
Source record: 235104

For those who want the earliest access to a distribution kit of the current version of umoria (that's 5.2.2), it's spending a brief period before massive release on SCAT bbs, in the suburbs of Chicago, IL. Phone number (708)231-7227. It's packed up with the oldest version of arc I could find, so ANYONE should be able to unpack it. Compiled with Mark Williams C, but the space penalty that imposes was made up for by compressing the executable file. There don't seem to be any major bugs, but I thought that when I distributed 4.87, so why believe me?

If you pick this up, please don't redistribute it beyond an immediate group that you can tell personally if a problem shows up. And by all means, if any problems show up, tell me immediately. At present, I plan to start spreading this around in a big way around Feb 10, unless something bad happens.

I/O is still through a pseudo-curses that uses the VT52 emulator, so it works in any video mode that cooperates with the VT52 emulator (I think that's everything except 320 x 200 color).

Again: I'll be sending this lots of places SOON, but this is a chance for the least patient people to get it early, and to catch machine-dependent bugs before they spread to too many copies.

As a bit of trivia, this apparently started out as a bug in GEM, but
they left it in for the later TOSs. As many know, NeoDesk
has this feature and even exapnds on it letting you resize, move,
expand, scroll, close windows.

Strange how these things evolve. No wonder Atari tends to call them
'features' instead of 'bugs.' ;^)

- I think I soon will need a CD-ROM.
- So please everybody having knowledge and/or experience about
- CD-ROMs + ST, please answer.
-
- What drives available? Where? Prices? Compatibility?

I've seen the Atari CD-ROM. It's strange seeing the Atari logo on such an exotic device.

Computer Rock in San Francisco advertises them in ST Informer, but they haven't had them or have been able to get them for months and months. I overheard the tech saying to a customer on the phone that Atari is redesigning it or something. (How's that for a big fat rumor? :^) I'm sure you can get them over in Europe better than we can here, but then you probably knew that already.

I guess you don't need to know about prices (around $600) and compatibility (I think High Sierra and ISO-something-something -- the major ones) since they're difficult to get.

I've looked for about a year, ALT-this-that-or-the-other, CNTRL-(same)
Space, etc, double click, you name it. Maybe there isn't one, but
it sure would be nice
As for TOS 1.4, you can abort copy/move-tasks with Undo.

Greetings,
RIPLEY

I just remembered something about these two questions:

> I could, also, do with some help on this level if at all possible.
> There are three trouble spots for me. If I can sort out one of them out, the
> others may sort them selves out.
>
> 1) How do you get passed the 'Test Your Strength' message.

You don't. I mean, you can, but don't bother. See below.

> 2) The gate that is just alittle further on but has no apparent
> key hole or switch

(My son taught me this one) Face the gate. With the crossbow, shoot a
Slayer (big green arrow) through the gate. Quickly jump to one side, because
the arrow will go through an invisible teleporter and materialize behind you.
If you don't jump out of the way, you'll end up shooting yourself in the back.
If you want, you can turn and watch the arrow sail past a few times.

The slayer will finally come to rest on a pad two steps behind the door, and
the door will open. The stuff down the passageway is good, but not essential.

If I remember correctly, there's a side passage at the pad. If you take a
step or two down the side passage, you will find yourself zapped down the
passage to the "Test Your Strength" sign.

>it sure would be nice

I think you should give up on that one, I think it is just a result
of the GEM event handler not returning control to the desktop until
the mouse is released, or the mouse is out of the menu bar object.

I tend to disagree, I have beckmeyer hard disk accelerator and it NOW
doesn't work with my brand new Mega STe.

I don't even know of one that does, except Atari's really absurd
cache program, which doesn't work worth a dam.

In article <8324.27a065e6@jetson.uh.edu> rcte2p@jetson.uh.edu (Paul S. Sears) writes:

2) I am interested in UUCP. What do I need to get things set up to get my
email and stuff? Arangements with the university should not be a problem. I
need information on what software I should use, what requirments there will be
of my system and some sort of shell program that can simulate a 'crontab' to
automate my uucp transfers...
The newest version of Mercury UUCP Modules is just coming over the
net. There are many additional utilities available for this system.

3) Does anyone know anything about X-Windows on the ST? I have tried and used
Unix Windows but I gave it up because of its slower speed than Uniterm. Or has
anyone optomized UW. I also have a suggestion to anyone that is... Have the
mouse curser off until the mouse is moved. It is annoying to see the mouse
flicker as the screen windows update.
You forget the purpose of UW, I guess. Anyway, There is an implemenation
of X for the ST and it is absolutely too slow to use it over a serial
line - I have seen it once on a direct link (9600 baud) and several times
with an Ethernet LAN-card. Even with a LAN-connection it is very slow.

That uw is slower than UniTerm is mostly due to the uw-protocol.
I agree on the mouse-flickering and intend to get away from it.

A few days ago I could lay my greedy hands on the source of the newest
uw-client I'm aware of and I am currently in the process to force them
into Turbo-C (which is quite a pain.).
(BTW: Does anyone know how to reach Bosch & Katzung via eMail ?)

4) What and where do I find a good C shell and C compiler? I have looked at
Sorzobon(sp?) and it seems ok.. I just am looking for more of an intergrated
environment. Has anyone written a GEM based shell to use for this?

If your equipment can cope with it you could get gcc. Another
alternative could be Turbo-C which is a decent development-system
and you still wear your cloths after purchasing it (that is, it
isn't overly expensive.)

960. usenet/mail binaries for Atari ST

Newsgroup: comp.sys.atari.st
Date: 1991-01-31 00:11:53 UTC
From: eric@abode.UUCP
Message-ID: <32@abode.UUCP>
Source record: 235117

I have been trying to get the files that were recently posted to comp.binaries.atari.st so you can use the ST to get usenet news and send mail. The binaries that were most recently posted on that newsgroup was supposed to be an eleven (11) part set. My site has only received parts 1-7 and I have not received any others in the last two days. Can someone send me parts 8-11?

Thanks

Eric

The Chassis of Atari Monitors are Earthed so there is no Real Problems
you are talking about TV's that have live chassis, this I will agree
that they can be dangerous, you must use a Isolating Transformer to work
on these, Well I am a Eng. and have worked on many a Monitor and a lot
of HV Equipment, I would not state something that is Dangerous, as long
as you use a LONG insulated Trimmer (Plastic Knitting Needle Filed to a
Screw Driver) will work, but must be 10" long.
Well I have been Zaped many times, gee I even glow in the dark !..

GEM has more serious problems than that with its double click. My father,
who is 60 years old and has unsteady hands, can't double click on his 1040
if his life depended on it. I think GEM doesn't recognize a double click
if the mouse is moved between the clicks, even if they occured within the
required timespan. I've never seen anyone have problems double clicking
on the Mac.

The Gulam 'cat' does not work properly. I once wrote a replacement which can be retrieved from the panarthae archive server as volume6/cat. Its also available for anonymous FTP from atari.archive.umich.edu.

The Atari ST Zoo is even smarter than the Unix Zoo: You can type

```
zoo a// archive mydir
```

to get 'mydir' with all files and subdirectories into 'archive.zoo'.

dave b. is a business man, out to make $$$. i am sure if any s/w he writes does not work on a new model, he will have an upgrade soon after of even before the hardware reaches the street. why don't u call them up and ask about upgrades? and i am sure that if it IS version dependent that i is that way for a very good technical reason: like that is the only way to do it (using undocumented, changable TOS attributes). and it is VERY difficult to predict the future nature of an OS :-). how can u expect any s/w company to write code NOW for systems years away? be reasonable.

why do u people think that just because u pay $39 for a piece of s/w, it should work on any computer atari ever makes for the next 10 years? of course you may need to buy upgrade s/w to stay current, especially system-oriented s/w like caches. that's life...

the mere fact that DC/beckmeyer/et al are still in business while others have floundered and died means that the buying public accepts their products, and recommends the to their friends. if not, they would be dead.

It seems to be bash Atari month.

I'd like to know in what way you find Atari's CacheXXX program absurd and
non-functional? I recently switched to it after finding the cache built into
my ICD booter to be less than optimal. I find Cachexxx to work much better
and uses less memory other than cache buffer space. Of course reading the
docs explains how to set up a variable data-fat buffer area for real fine
tuning.
Does it really break on the mega, or have you even tried it?

>Do I just add lines to ASSIGN.SYS, or is life not that simple ? If that is
>the answer what format should the line be, is it just:

>VARIABLE=value

>like the path commands?

The safest way to set env vars is to use a command shell that can do this.
Desktop doesnt support the feature, although AES does (RSC files will be
sought on all folders that are in PATH if not found). The Okami Shell makes
use of env vars, and so does Gulam. Forget any shell that does not.

Some tech info wanted?
The pointer to a process's environment is in the basepage (Offset 0x2c I
suppose). It points to a memory area which has the following format:

{VarName=Value\0}\0

, meaning there is a set of \0-terminated character strings, each of the
format "Name=Value". The set itself is \0-terminated, so a double \0
indicates the end of the list.
Sometimes another \0 is included after the '='.
When a program is executed using Pexec, the last argument of Pexec is
placed in the new process's basepage to make the env pointer. If the last
argument is NULL, the calling process's env pointer will be used, so make
sure to pass NULL instead of "" when executing programs from programs that
do not make use of the environment.

Using the environment is merely a lot of what we call in german "pointerfummelei".

Hope to have helped you

Okami-San

From: news@prles2.prl.philips.nl
Message-ID: <2502@prles2.prl.philips.nl>
Source record: 235137

It would be very interesting to be able to transfer files
visa versa between the Atari ST and Portfolio using the
Parallel interface card.

As I have been told this doesn't work, even not with the supplied
MSDOS portfolio software under PCDITTO on the ST.
It seems that it is possible to make some connections on the
parallel interface cable, und thus enabling bidirectional
communication via the par. interf.
Does anybody have any info on this, and which signals are used normally
with a real PC machine.
Is there a Public domain program for the ST or PCDITTO to communicate
with the Portfolio + Par. Intercafe (with build in software),
or have info to enable me to write meself.

Fons Bruls, Philips Nat. Lab, Holland

>and he's not sure if it's the codes that are wrong or (more likely)
>the syntax he's using works with some codes and not others. Thanks again,

The system in which a number is displayed doesnt change anything about the
number itself, and in C it is possible to use numbers in oct, dec and hex
very easily. For instance, if you wish to send a number to the printer
in binary format (that means send the number 123 and not the string "123"),
use the following form
fputs("\123",fp);
where 123 is the number in octal and fp is a FILE* opened for the printer.
(you can use any 3-digit octal number after the backslash.)
If you have the number in a different format, no problem:

printf("%c",(char)123); sends decimal 123
printf("%c",(char)0x123); sends hex 123
printf("%c",(char)0123); sends octal 123 as well.

For example, to send a control string like ESC 1, use
printf("%c%c",(char)27,(char)1);

But watch out: some printer codes don't require the number in binary but
in ascii, so you would have to send to send the ascii code for the character
'1' (which is 48) instead of the number 1. No problem with C: simply change
1 to '1' to get the ascii code. You could do things more simply then, however:
printf("%c%c",(char)27,'1') will do the same as
printf("%c%d",(char)27,1) or as
printf("%c1",(char)27) or even as
fputs("\0331",fp)

So find out first if the printer code is binary or ascii. Epson printers
usually understand both.

BTW: the cast to char in the examples above shouldnt be vital but is recommended.

>monitors, is fully insulated, so there no real problem...

There is a saying "Its the volts that jolts but the mils that kills".

Don't trash safety advice. That saying only holds true for a normal
healthy adult. High voltage working is not for the uninitated who
may not understand the risks.

My advice is simple:
if you do not know where the risks are either do not touch or
enlist the help of someone who does. Don't get him to do it though
as you will not learn for the next time.

John.

980. Researching PD Software For Ensoniq Synthesizers

Newsgroup: comp.sys.atari.st
Date: 1991-01-31 12:52:16 UTC
From: rost@aqua.enet.dec.com
Message-ID: <3865@ryn.mro4.dec.com>
Source record: 235140

I am currently researching an article for the Transoniq Hacker magazine. The subject is a survey of public domain software for any of the various Ensoniq keyboards (ESQ-1, SQ-80, Mirage, EPS, VFX).

I would like to hear from anyone on the net who has in their posession any PD programs, such as patch/sample editors, patch/sample librarians, utilities, etc. for *any* personal computer that is in the public domain. I am *not* interested in non-functional demos that you may have, such as patch librarians that cannot write back to the synth. I am also not interested in patches or samples themselves (not for the article anyway...).

The information I need on these programs is:

1. Name of the program, version number, the author (if known) and his address.

2. Your source for the program.

3. What hardware configuration is needed to use the program (memory size, monitor type, MIDI interface type, disks, etc.).

4. Brief description of what it does.

5. Whether or not you have access to dump the program to me over the net.

6. For Atari and IBM programs, whether or not you would be willing to copy the program onto a 3.5" floppy I would provide.

Please make all replies by E-mail.

Brian Rost @aqua.dec.com

Have you reFormated your drive ?? this could fix a week sector, do you
get ICD error massages ??, also there should be no need to use FolderFix
with the ICD Booter as this has it built in ..also it would be a lot
better to get your TOS upgraded to 1.4, as this problem with the folder
fix has allmost been eliminated, can't crash your system now, you get a
warning message, Note Folder999 will chew up a bit of Ram !!

From: comeau@crc.skl.dnd.ca
Message-ID: <1991Jan31.142752.5468@crc.skl.dnd.ca>
Source record: 235065

On the subject of Gulam, perhaps someone can suggest a work-around to a problem I've had. Suppose I execute a Gulam script (a "*.g" file), then subsequently edit that script. If I try to execute the script again, Gulam displays the message "Old buffer" and executes the script as it was before I edited it.

What I want, of course, is for Gulam to execute the new version of the script. I should point out that I use STeVIe for editing, and not Gulam's built-in "ue" editor.

Thanks for any help.

>effect on my programs, to say the least.
>.........
>Has this problem been sighted before?

Maybe.
We have about 5 or 6 different machines here and we all have lost
some subdirs here and there. Especially STe's seem to have the problem.
When we dove into it it turned out that in the directory, from a
certain entry onwards, everything had moved up one byte! So the Nth
file was missing the first char of its name and evreything after it
had moved one byte. So indices into the FAT, time/date stamps, length
etc was /completely/ f*ked up. We had this about five or six times now,
(in one year) but nobody believes us. It looks like a severe timing
problem.
** Atari guys, are you listening? **
Remember the ~10% of the Ste's last year that hed a timing problem
with the DMA? It was fixed by adding a capacitor somewhere...
Well on those machines it was reproducable. I made a little
something that kept making and deleting subdirs and after an hour
or so it went bang.
Any body else?

Source record: 235145

A small (and I hope reasonable) request for Bob Retelle and other members of the comp.sys.atari.bashers.club:

Would it be possible for you to add a uniquely identifying string to the subject line of all your posts and followups? Something short and to the point, like "[abc]". This would serve two purposes:

1. My enjoyment index for comp.sys.atari.st increased dramatically when I created a KILL file with these two lines:
/cmm1@cunixa.cc.columbia.edu/h:j
/Bob_BobR_Retelle@cup.portal.com/h:j
However, I'm usually no more interested in the followups to your posts than the originals themselves. I can weed out most of the followups by changing the "h" to an "a" in the lines above, but then rn has to scan the full body of each article for your address, which can take an annoyingly long time if I haven't had a chance to catch up on the news for a few days and there are a lot of articles pending. If you were to put "[abc]" in the subject line, then rn could catch all of your posts as well as followups to them just by scanning the headers.

2. If all ABCers adopted this convention (are you listening, Chris?), then rn could do a _single_ pass through the headers to weed out all of the bash trash, saving considerably more time.

Come to think of it, there might be a third benefit:

3. On those rare occasions when you want to contribute something useful to the group, you could simply omit the "[abc]" in the subject and the rest of us could read what you have to say, instead of junking all of your posts indiscriminately.

Retelle and Mauritz should obviously be charter members of the Atari Bashers Club. Others could be nominated by net consensus, should the need arise (and assuming a cooperative spirit all around). And of course, everyone is free to admit themselves to the Club on an occasional or permanent basis, simply by sticking the appropriate string in their subject line.

So what do you say, guys?

Can anyone send me details of this useful thing. Specifically I
would like to know the connector types, pin to pin connections,
and the wire colours for each pin (if I'm disecting existing cables),
so that I can knock one together instead of mail ordering it.

While I'm at it, can anyone in the States tell me whether the following
were ever released by Epyx for the 8-bit Atari :-

Summer Games II
Winter Games
Impossible Mission.

Did Microprose release Gunship?

Finally, can someone give the address of what they consider the best
international mail-order firm for 8-bit stuff in America.

Thanks in advance for any help,
Mark Keates.

Uh, have you ever seen your father (or any other 60-year-old with unsteady hands) double click on a Mac?

If you take your hand off the body of the mouse to do the clicks, the chance of accidentally moving it between clicks goes down. Awkward, but if his life depended on it...

Your father might find a trackball invaluable here. Even the unsteadiest of clicking fingers won't move that sucker if you keep your hand off the ball.

In any case, this clicking business is a pretty lame thing to center a review on. Hopefully he spent a good deal of time on quality of the hardware, application software, and price. Since the review was specifically of STacy, concentrating on STacy-specific things (like portability, the LCD screen, the trackball, etc) would also have been nice.

- I mean what point is there to upgrading the ST if the new ports you
- put onto it aren't carried over into the higher end models???

My guess is that not many people buying a TT or even a MegaSTe will
miss them. I have an STe and I obviously don't use them, and never
intended to, quite frankly. I don't even take advantage of the
4096-colors, stereo sound, or blitter (although it's nice to see a
demo now and then), since I don't play many games. I bought the STe
for Rainbow TOS and cheap-and-easy RAM upgrades, and I'm looking at
the MegaSTe for some acceleration and a nice, extended keyboard. If
it had 1.4meg drives, I'd like that too, but it doesn't. There are
'more important' gripes I'd have over the MegaSTe than whether it had
the 15-pin analog ports, like increased resolution like the TT has
(can anyone explain why it doesn't? There MUST be a good, probably
technical, reason why.). Then again, Atari IS promoting it as business
machine.

One of the issues of START magazine had a generalized-all-purpose
printer-driver-generator written by Tom Hudson (author of Degas). He probably
got tired of getting requests like "I need a driver for my <strange device>".
I have it on disk at home, but you might check atari.archive for the program
there (sorry, don't remember the name).

The excitment is building as level 13 approaches....
Anyway, on level 10 using x-ray vision i noticed a couple of secret
rooms next to each other with items in there but i couldn't access them.
There is apparently also a two-square room with a force field and one
item in it that i couldnt get to.
Presumably the two alternative passages which start with "choose a door"
are not both visitable in one session ??

I've visted them both (from seperate starts) and they each have two
bits of food. I tried throwing
stuff through the grated door to drop on the pressure pad but this didnt
operate it so i guess only one path is possible. any ideas ??

anyway onto level 11 tonight...

Here's an expanded list based on e-mail input and some experimentation
at home. If you want to test your skill, try to copy a file from a
non-foreground window to another window without raising the source
window and without using the mouse :-).

Legend:
alt = Alternate
ctl = Control
del = Delete
[cursor] = any of up, down, left, right arrows

"Classic" GEM keys:
alt+Help screen dump
Return accept default dialog button (the one
with the bold outline)
Esc re-read disk for active window; ALSO,
erase GEM text input field
left click+Shift toggle file selection (allows multiple
selections)
hold mouse right+left click select file from background window

"Classic" GEM keyboard equivalents to mouse actions:
alt+Insert left mouse button
alt+ClrHome right mouse button
alt+Shift+[cursor] move pointer by 1 pixel
alt+[cursor] move pointer by 8 pixels
alt+Insert+[cursor] left drag

TOS 1.4 GEM keys:
left drag+ctl move instead of copy
ctl+alt+del warm reboot
ctl+alt+shift+del cold reboot
dbl-click left+Shift run program in background window with
current directory set to background
window directory

Show file keys:
space page forward
return line forward
q exit show
d half-page foreward (TOS 1.4 only)

1012. Sam Tramiel funny

Newsgroup: comp.sys.atari.st
Date: 1991-02-01 00:08:25 UTC
From: saj@chinet.chi.il.us
Message-ID: <1991Feb01.000825.17805@chinet.chi.il.us>
Source record: 235077

For those lucky people who didn't try to participate in Sam Tramiel's real time conference on Genie on 1/30/91: Genie kept crashing and logging people off. The question delivery mechanism broke. It was a mess. Sam took it *relatively* well (as did about half of the rest of us). Anyway, someone asked how he felt at being the subject of so much attention that it broke a major on-line service. First he said that they should get better software. Then that they should get a better computer......like a TT.

For reference: I think Genie runs on a few connected Amdahls.

There was a little news, but nothing that would surprise regular readers of c.s.a.st.

carter@cat34.cs.wisc.edu (Gregory Carter) writes:
>I don't even know of [a disk accelerator] that does, except Atari's really
>absurd cache program, which doesn't work worth a dam.

You might not understand what CACHEnnn does. If you think it is supposed
to do something that it doesn't do, you will think it does it badly.

Try this: without running CACHEnnn say "show info" on a disk (floppy or
hard). Now say it again. Took a while, right? Had to hit the disk both
times, right?

Now run CACHEnnn (with nnn at least 020) and and do it again. The second
time you "show info," the disk isn't accessed, because the information is
in memory already. That's an example of what CACHEnnn does.

(This demonstration won't work with a write-protected floppy, because the
second "show info" will actually read the disk to detect media change.)

CACHEnnn doesn't do much good on a machine with TOS older than 1.4 because
those versions used the cache badly: adding more buffers to a badly managed
cache doesn't help. But STe's have TOS 1.6 or 1.62, so that's not an issue.

> --> Yes I'm reading this regularly, as all six TT owners of Finland <--

According to the latest version of ST World I have (British version - Quarter 4, 1990, Issue 53), there is a chip called HD-MODUL available from CompuWare. It piggybacks on the ST's (sorry, no mention of the TT) disk contoller, enabling the ST to format and use any 1.44Mb drive (includes formatting software). Works with both internal and external drives.

The article also lists The Atari Workshop in London as a distributor. Anyone in England able to elaborate on this?

Bob was a little harsh (as usual), but he does raise a valid point. Why
did Atari require a daughterboard? I'm sensitive to this having just paid
$275 to upgrade my ST from 1Mb to 2Mb. Of this, only $50 was for the
extra RAM. $175 was for a daughterboard (including installation) and
$50 to replace the 1Mb of RAM that had to be deactivated on the motherboard.
Why do I have to play the daughterboard game again with the TT?

You don't HAVE to play the "game"... You don't HAVE to buy
a TT.

Do what I am going to do: buy the Gadgets 33Mhz 68030 that
COMES WITH the co-processor and 8 FREE simm slots.

I was seriously thinking I was going to buy the TT as soon as
it comes out.. within the next 5 or so years, in other words.

But, I would rather support David Small who seems EXTREMELY
interested in supporting his customers and providing them
with a variety of options. He's even open to suggestions!
He actually "listens" to what people want and are willing
to buy.

But we shouldn't jump to conclusions prematurely: the TT
is not on the shelves, so WE really don't know what options
we will have. I don't think ATARI knows what they're going
to give us either, to wit Allen's recent comment that he
didn't "know if it were true or not" that one could buy
a diskless TT. He did emphasize that you MUST buy a
daughter board for memory from ATARI, in other words,
your TT doesn't come with empty simm slots.

I think we know that much.

Someone correct me if I am wrong, please.

kevin

jhenders@jonh.wimsey.bc.ca (John Henders) writes:

- I'm pretty sure the internal harddrive on the STe is an
- imbedded SCSI drive plugged directly to the computer, so there is scsi
- there.

I've heard it's a ST-157N 48meg drive. What I'd like to know is if
it's the 28ms or the 40 ms version.

- Whether it was brought out the back of the computer or not,
- sorry, I didn't look. Ilike the concept behind the Mega STe1. It's
- basically a dealer configuable box, as the cost on 256k simms
- appearantly is about 3.00$. Now if someone could come out with a board
- which used a bunch of 256k simms to make a 4 meg board that fit the 4
- simm slots, there'd be a use for all those excess simms.......

A Computer Science graduate who now works for CSUC told me a few
months ago that they were working on such a hack, to have 4 256K SIMMs
assigned to one slot.

- Someone mentioned here that the 2.5 meg configuration didn't
- work due to a bug in tos 1.6. If what I've heard is correct, this
- is wrong. The new mmu is part of a larger chip with other custom chips
- incorperated into it. I'd say the logic to support the 2.5 meg config
- was left out to simplify design, rather than from malice.
^^^^^^
Yeah. I think a lot of people believe that the Tramiels are 'out to
get them.' The inconveniences are usually due to cost-cutting
schemes which the average user wouldn't be concerned about.

Oh, BTW, I've heard it's TOS and not the MMU that causes the bug.

1019. Atari entries in '100' list

Newsgroup: comp.sys.atari.st
Date: 1991-02-01 07:21:37 UTC
From: ekrimen@ecst.csuchico.edu
Message-ID: <1991Feb01.072137.1063@ecst.csuchico.edu>
Source record: 235075

The January 21st issue of _MicroTimes_, a Northern California computer magazine, included their 4th annual "100," a list of Industry leaders "for a turbulent 1990," compiled by their editors. So, in the same list as Jonathan Seybold and John Sculley is everyone's favorite person, Uncle Sam Tramiel. His paragraph reads:

Sam Tramiel

President
Atari Computer

Tramiel took a lot of heat from unhappy ST users in 1990 over his apparent decision to emphasize Atari's historically strong European market at the price of near-invisibility in the US. Leaving aside the probability that Tramiel will have the last laugh in 1992 when the company's an EC household word, by COMDEX Atari was showing and shipping some new ST technology, maintaining its commitment to technical excellence at low cost, and apparently making serious attempts to mend its fences with its fanatical and long-suffering user base.

Seeing Sam Tramiel in the list was not as surprising as seeing Donald Thomas's name in it. He gets the award for the longest title, and at least one of the longest entries in the list.

Artisan Software

Author
The Revolution Handbook

Thomas is the quintessential hardcore Atari ST user. By day he works at Atari helping customers with Portfolios, Atari's DOS-based videocassette-sized computers. By night, he works in his ST-filled house in Manteca, running his ST software company, Artisan. He also spearheads something called The Revolution.

Lots of Atari users have long been frustrated at the company's failure to aggressively promote the machine in the US -- a frequent comment being that the company is doing so well in Europe that it doesn't have to worry about the US market. For most American ST users, moving to Dusseldorf for better hardware and software availability is not one of the options.

As an ST aficionado and software developer, Thomas worried about the prospect of the ST not only failing to achieve the installed base it deserved, but utterly vanishing from the face of the continental US. So he did something about it. He published, online (CompuServe and GEnie) and in hard copy, /The Revolution Handbook/. Which, among other things, exhorted ST users to be vocal about their product and support needs. A frequently recommended activity is writing letters to Atari President Sam Tramiel.

In a recent profile in /STart/ magazine, writer E.J. Koch explains the delightful irony of the situation: "The company is close-mouthed regarding Thomas's efforts. Sam Tramiel refused to comment, but offered Thomas as his spokesperson regarding The Revolution. Tramiel is in the strange position of having his customers usurp his business plans. On one hand, any publicity the Revolutionaries generate supposedly benefits his sales, but on the other hand, he's being pressured to spend advertising money where the customers, not the company owners, think best. And to top it all off, he is Thomas's boss."

Source record: 235072

mjs@hpfcso.HP.COM (Marc Sabatella) writes:

>Well, some applications, upon finding the feature, might insist on using it,
>and not leaving it up to the user. Someone might write an application that
>creates internal data files named "foo" and "FoO" and requires them to be
>distinct.

In addition, many programs convert all filenames to lowercase before presenting them to the user (especially command shells)(the Okami Shell leaves the decision whether or not to convert to lowercase to the user). In this case, "foo" and "foO" would turn into the same filename. But do you really plan to use filenames that differ only in their cases?
New programs would certainly not rely on filenames being case indepentant in order to stay compatible. So they will certainly not trust in foo and foO being different files. Using files that differ only in their case would be discouraged on an OS with optional case insensitivity anyway because turning the feature off would suddenly make a lot of files have the same name.

As for myself, I dont really miss case insensitive filenames, I'd rather see a Unix filename convention that doesnt force filenames to the filename.ext convention. How about the difficulty of implementing that? In the disk directory, the filename "foo.bar" is written "foo bar", and programs (like Fsfirst) replace the spaces by a singe dot. If the directory entry was "foo.bar.baz", it should be possible to recognize that this is not a standard TOS filename, so an OS extension should be able to handle filenames in both MSDOS and Unix convention.

Back to the case insentivities, there is however one advantage given by filenames being not case sensitive: if you are using a command shell which has, say, an internal command named "test" (it will have if it resembles the Bourne Shell) (guess which Shell does?) and you have a program called test.prg, then typing "test" on the command line will invoke the internal command, so you have to run test.prg by typing c:/bin/test.prg or something if filenames are case sensitive, but if they are not, you can simply type "Test" to invoke the external command (which is I suppose a lot easier to type even for people who do not like to use the shift key.)

>on the Mac.

This is somewhat drifting from the point but....

I agree that can be a serious problem. It seems that GEM takes the
click on the pixel rather than the icon. A solution for your father
and anyone like him is to use a tracker ball. In this you can set the
pointer position and then remove your hand from the ball to click.
Any movement of the unit does not alter the pointer position and so
should over come the problem. The same could be achieved by lifting
the mouse of the desk to click, but that is getting silly.

This is TRUE and a safe practise is always to discharge large value caps
before working on equipment no matter how long it has been since the
equipment has been switched on. Remember: Tubes have capacitance.

In article <ENTROPY.91Jan30184418@pogo.ai.mit.edu> entropy@ai.mit.edu (entropy) writes:
>A TV or monitor can retain a lethal charge for more than 2 years after
>it is unplugged (especially older TV models). There are ways of
>safely discharging caps and tubes, refer to a TV repair manual for
>more information.

Long - yes, That long - **no way**. As above I always advise caution
but scare mongering based on half fact helps nobody. Lets keep this
advice to sensible levels, after all working on HV equipment is
quite safe as long as proper procedures are applied. The objective
must be to help people to learn, not to unnecessarily scare them off
ever opening the cover.

>him but he just jumps right out when I try to fuse him!

>any ideas you guys???

You have to fluxcage the fields *surrounding* lord chaos. This is easy if you
guide him into an edge like this:

wall: # ##########
you: o ##########
lord chaos: @ ##@.
flux cage: . ##..
##o
##

Now you can fuse lord chaos and enjoy the *nice* end sequence.

From what I read Atari replaced the DMA chip, as there was a faulty batch, they also stated that the DMA cable must not be longer than 12", that is very funny as there cable is 19" long, I have read that some machines had the Atari Mod: done but they still did not work with Atari hard disks, also read that Atari came out with a New main PCB for the STE...I did read that ICD investigated the fault, most were because of noise,(Data Books on TTL do state not to run TTL more than 12"), but did find the byte shifting problem was posibly the DMA chip ..also noted that a few dealers were replacing the DMA chip with some from older machines. I would like to bye a STE, but will wait till all the bugs have gone, Unable to get Atari to state if TOS 1.62 has the PoolFix problem removed...

I've noticed this also...to click and drag you must ckick and hold until the icon changes to an outline only then can you drag the icon around. I can put up with it, but it is very different from the macs at work and there is always a period of adjustment of 3 or 4 attempts before I get into the new habit.

In the dark no one can hear the color of your eyes.

TDI vanished several years ago. I had their development system (version
3 I think). Unfortunately, some of the bugs in version 1 that got fixed
in version 2 reappeared in version 3, so a lot of my code broke. It had
some nice features and was reasonably fast if you compiled in a RAM
disk, but due to lots of disk access it was slow compiling to disk.

1036. Using GDB

Newsgroup: comp.sys.atari.st
Date: 1991-02-01 17:08:26 UTC
From: dinapoli@rodan.acs.syr.edu
Message-ID: <1991Feb1.170826.791@rodan.acs.syr.edu>
Source record: 235091
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Howdy! I've been having a problem getting GDB to work on my MEGA 4.

If I compile with the -gg switch, the resulting symbol files cause
gdb to crash when I attempt to load them.

If I compile with the -g switch I get the following error message when
I attempt to link the executable...

Bogon alert! wrote 213 symbols, expected to write 235

I'm not sure about those numbers, but that was the general error message.
the executable is produced, and the symbol file created with sym_ld does
load properly into gdb. But when I attepmt to run the executable from gdb,
I get "Program terminated with code #ffffff95" (again, not sure of the
number).

Does anyone know how to create good symbol files and good executables???
I can't use the -mshort flag because I need to have 32-bit ints (if that
makes a difference).

thanks for your help!

Ron D.

Back then I responded:

>I have had no problem with them. There are various gotchas alluded to in the
>manula, but in my opinion, they are obvious, and the manual gives them far too
>much attention, making it look like they are difficult to deal with when in
>fact it is trivial. The problems have do do with offsets in the arrange list,
>and if you're doing notation, you probably aren't using arrange mode anyhow.

Now I've changed my tune slightly (no pun intended).

I am trying to put together a songbook, and would like to keep the individual songs in one .SON file, so I can control formatting et al globally. I had planned to go with one song per pattern, theoretically giving me 99 songs.

But I'm having trouble getting the time signature changes or double/repeat bar lines for each song to be independent. Because they are global to the song and not to the pattern, time signature changes or double/repeat bar line markings in one pattern affect all the other ones. So I turn on Arrange Mode, and Global Positions, so now I can get independent settings for each line of the arrange list, but I can't get all 99 patterns in an arrange list. Another really gross option would be to start each pattern "n" at bar "n"*100.

I thought of storing each song as a pattern, so I could keep the formatting settings global in the .SON file, but this shouldn't do any good, since I would assume the time signature changes and bar lines markings would not be saved as part of the pattern, but rather as part of the song. I suppose I should check this out, though.

Does anyone else have clever workarounds for this? Kevin, did you run into this when you were trying to do your book on Notator?

please note that gulam.tex cannot be run with the vanilla texinfo.tex
file from FSF. we had but a few hacks in there. So please use the
texinfo.tex that was distributed with gulam in comp.binaries.atari.st.
There seem to be a few archive that dont have the complete
distribution. I'll be glad to mail out the missing file to maintainers
of those archives.

Thanks for the flames people! Well, let me state, that as far as I am concerned Atari is heading the right direction with their STe.

I really enjoy my machine(Mega STe), otherwise I wouldn't be writing about my current situation.

PLUS might I add, the new desktop (TOS 2.05) is nothing short of VERY USEFUL. I am very pleased with it.

But for that matter on to someting a little less trivial:

Does anybody KNOW where I can get information about the internals on the MegaSTe? I have so much I want to do, yet can't do it because I actually don't have the faintest idea where everything is?

Message-ID: <1991Feb1.182742.1@wharton.upenn.edu>
Source record: 235100

Hi!
My color monitor, SC1224, is constantly making high pitched sounds.
I have taken it to my local dealer and he said that all ATARI monitors
make those sounds. I doubt this. My friend has one of the older color
monitors and it doesn't make any rude squeals. If I lightly slap the
monitor the sound goes away. I know, I know that isn't the way to fix
something but what else can I do? Also, when there are no squeals coming
from the monitor the speaker constantly hums. What can be done about that?

HELP!!! -> Greg.

I've begun considering the purchase of a flight simulation program
for my 1040ST. The only point I'm considering right now is which programs
are not distributed on copy protected floppies. That is to say I don't
mind "lookup something in the manual" type protection or "dongle"
protection, but I refuse to buy a program distributed on a floppy that
cannot be backed up. So far I've had "Falcon" recommended. Are
there any others I should consider?

>>similar database programming language.

>Yes, there is. It's Superbase Professional by Precision Software. It's
>better but still compatible with dBase.

Superbase Pro is NOT compatible with dBase - only the data files are.
There is a program called dBMan which is 100% dBase compatible, also
with many useful extensions. In fact, dBMan is available for 40
platforms, from the ST and Amiga through Unix machines all the way up
to mainframes. All programs and data are compatible across all platforms.

dBMan comes with a compiler, report generator, and assorted utilities.
It has more features than you can shake a stick at. If you have serious
database needs, check it out.

Source record: 235213

In article <1991Jan29.150844.13336@raid5.uucp> tony@raid5.UUCP (Tony Andrews) writes about Sozobon C:
|> Just what is it's current status?
| Works well under a TOS shell. Does not work under MINT.

I don't know if this is common knowledge, but the thing not working under MiNT may be fallout of the dLibs runtime - I use Sozobon C pretty much religiously here on Pell, and I also run MiNT. The only modifications I've done are to write my own cc frontend (part of Orc's toolkit, which I will gladly post to .sources. if people want) and to recompile hcc & top, then linked those three with my own C runtime library. It works fine, without any nastiness. (I run 1.0 - I was bit fairly badly by 1.2 and backed off from it.)

|> Any chance of the ANSI standard becoming a reality?
| What is the purpose of ANSI besides making it possible for a
| perfectly good program to generate infinite useless error messages?

Prototypes are really quite nice. Lotsa C progams of interest are being written these days with prototypes - it's rather a pain to try to unprototype them.

| Who is volunteering to produce an ANSI libc?

I've a good subset of the ANSI libraries. If Dale is reading the net, I'd be happy to fling bits at him to help him fill out dLibs (which is pretty close to complete anyway) with all of the appropriately ANSI functions and behaviors.

Jim,
As an owner of many filght sims for the ST I would say the bast one out
there is the F-19 Stealth Fighter. It is excellent and is easily more
entertaining and last longer than Falcon. However, Falcon is good too. I
play that a lot as well. If you are just interested in more of a shoot'em
up get the F29 Retaliator. It lacks real depth, but it is a good time
consumer. But for the long haul, go with F-19.

1054. PCDITTO2 Fix

Newsgroup: comp.sys.atari.st
Date: 1991-02-02 05:39:09 UTC
From: marshall@batserver.cs.uq.oz.au
Message-ID: <7139@uqcspe.cs.uq.oz.au>
Source record: 235209
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I had a problem with PCDITTO2 (and PCD1), which is now fixed.
PCD2 ran OK, except it would not recognise the hard disk.
My H/d is a Megafile 20, with 2 partitions: C 14Meg, and D 6 Meg.
Mostly I use D for PC stuff.
PCD ran programs from floppy with no complaint, and allowed me to change
directory to C or D. But when I tried to run something - say "dir", from
C: or D: it gave the message "Divide overflow". Likewise if I tried to
access the hard disk while in an A: directory.
After much blood, sweat, and tears, and backups and reformats and
repartitionings and backup restores I fixed it, as follows.
The Mgafile manual advises that the Megafile 20 should be treated as an
SH205. PCDITTO2 AHDFIX says that it should be applied (AHDFIX.PRG, that is)
to SH204 only. Eventually I ran HDX to remove and then install the H/D
driver, and IMMEDIATELY after quitting HDX, ran AHDFIX. That did the trick!
I had tried, once before, in desperation, to run AHDFIX, but I hadn't
realised that it MUST be run IMMEDIATELY after running HDX or any of the
zeroing or partitioning or formatting processes.
BTW: PCD2 runs every PC program I have tried so far:
in particular: MSWORD, QUATTRO, QED, TurboPascal, all the compressor/archivers, Fastback,
and many others.
But there are now much better PC emulators around.
Hope all this helps.

>Uh, have you ever seen your father (or any other 60-year-old with unsteady
>hands) double click on a Mac?

He has no trouble with the Mac double click. Incidentally, he uses an ST
because he says it's got the only usable accounting system he's seen on
a microcomputer (Best business management system). Too bad the company
doesn't really do ST development any more.

>If you take your hand off the body of the mouse to do the clicks, the chance of
>accidentally moving it between clicks goes down. Awkward, but if his life
>depended on it...

Actually, it goes up. Unless you're pretty deft with your fingers (like us
youngsters), you nudge the mouse when you click. I find I've been anchoring
the mouse with my thumb and pinkie without thinking about it all along.

>Your father might find a trackball invaluable here. Even the unsteadiest of
>clicking fingers won't move that sucker if you keep your hand off the ball.

The trackball is not as nice an interface as is the mouse, in my opinion.

Sure looks like some kinda bash to me

>
>I didn't make ANY comment on HOW the software was written EXCEPT that
>for ME its USELESS on my machine. WHICH IT IS. What the hell does
>that have to do with me liking Atari or not?

Well, from your article quoted above, I don't think the above statement
really quite washes, does it. No mention of " Atari's really absurd
cache program" breaking specifically on a mega ste. Just that it doesn't
work "worth a dam(sic)." Strange if it is broke on the Ste as it works
fine on the TT. I pointed out that in recent tests I'd found that "Arari's
really absurd cache program" worked better for me than ICD's much acclaimed
caching booter. I asked if you'd tried it.
I response to your request for info on cache programs to try as possible
replacements, there's Cold Hard cache, sometimes called cachev3, also Keith
Ledbetter's Lcache, and Dcache from Germany. These are available on most
BBS's and on the commercial services as well. I'm sure some or all are
probably available on atari.archive as well.
Dave Beckermeyer reads this group, so perhaps he'll offer you an upgrade
to your accelerator.

re: Falcon

The latest version, 1.2 of Falcon, is unprotected except for the use of a code wheel. It even installs on the hard drive, though there may still be a problem with the ICD booter, which is larger than the others and originally didn't work. Falcon has various reality level's making it anything from a straight arcade game, to a full blown simulation. There are also 2 extra mission disks, handy when you get bored with the first game. I recommend Falcon highly.
Some people like F16 Combat Pilot, but I found the scenery to be a bit less detailed, to the point where it's difficult to tell if you're flying at 20 feet or 2000. F19 also is nice, but the focus is stealth and the plane doesn't dogfight very well. There's also Fighter Bomber and a really pretty one from Ocean whose name slips my mind. These are the sims I know about that are worth looking at. Some people like Flight Simulator 2, but if you're looking for a combat plane, look elsewhere. Also to be passed on, IMHO, are JET, and Chuck Yeager's Flight Simulator.
Battle of Britain is nice, but it bogs down a bit when things get busy. Really slick on the TT though. Haven't tried it on the Mega Ste. Due very soon is Flight of the Intruder, from Rowan Software, for Spectrum Holobyte. This promises to be really nice. As a final suggestion, if you do buy Falcon, make sure you get the US version, rather than the European import.

Just a few suggestions from a flight sim fanatic.

The SM 124 Monitor uses a Power Transformer for insulation, Note : the
Output Voltage is 11.8 Volts, I don't think that this will Kill any one
I have worked on a Few of these monitors, Some of you are getting facts
wrong about these monitors, They don't use Switched Mode PSU, so they
don't have the High votage that these PSU have, The EHT is 10.5 KV, and
this is Fully Insulated...I don't see what is the Problem ???

1062. Hard-copy prg for EPSON LQ-500 compatible printers

Newsgroup: comp.sys.atari.st
Date: 1991-02-02 16:50:46 UTC
From: hohr@cernvax.cern.ch
Message-ID: <4031@cernvax.cern.ch>
Source record: 235216

Hi netters!

I've written a small (~2k) prog. to do screen dumps on EPSON
LQ-500 compatible printers. So it works on my BROTHER M-1224L
and also on an EPSON LQ800. It is avaible on
atari.archive.umich.edu under atari/printing/hc24_v11.lzh
(thank you John!)

I've forgotten to mention (in the small doc) that it works
only in hi-rez mode.
Put-it in your AUTO folder and forget-it:-) With SPOOL.PRG,
you get the hand back after ~7 seconds. The circles on the
screen are also circles on the paper :-)

Enjoy
Roger hohr@cernvax.cern.ch

1063. evnt_button() returns 0: why???

I'm not sure if Gunship was ever released for the 8-bit. Winter Games wasn't released by Epyx, but some other company did make a clone of it, though I forget who it was (Winter Olympics I think the game was called). Not very good anyway. Summer Games II - nope.

As for the best mail order Atari place in the US, for selection and price, I think I'd have to nominate:

B&C ComputerVisions
3256 Kifer Road
Santa Clara, CA 95051

Write and ask for their free catalog (or call 408-749-1003). A good selection of software, both commercial (even a few NEW things from independent developers/enthusiasts) and PD, and lots of hardware (refurbished systems, upgrades, cables, power supplies, repair parts, accessories, peripherals, etc)

-Ray

>aloft!wao

SOFTLINK is a product by C-LAB, the makers of CREATOR and NOTATOR midi software. The SOFTLINK.prg came with the update to 2.2 version of NOTATOR (and CREATOR). REVOLVER and SOFTLINK are quite different. SOFTLINK allows for limited MULTITASKING: you can run multiple midi programs concurrently and exhange midi datat real-time.. and you can also run GEM and TOS programs while running midi programs CONCURRENTLY. Softlink partitions your RAM, but doesn't revolve it out to disk. SO, there are a couple of the differences between the two programs. C-LAB *WAS* working on another 'level' of SOFTLINK that would multitask GEM and TOS.. but dropped development when they heard ATARI was putting out a multitasking autofolder program. Well.. we never did see that ATARI program.. and C-LAB hasn't returned to the development of a more powerful SOFTLINK.

AN example of what i have been able to do with SOFTLINK:

Run NOTATOR in partition 1 Playing a sequence
Run TEMPUS in partition 2 printing a file
Run STalker as an accessory in parition 3 in BBS mode
and have a friend log on remote and run gulam off my system.

1067. ATARI MEGA 4ST MONO + 30 MB HD + HP LASERJET IIP FOR SALE

Newsgroup: comp.sys.atari.st
Date: 1991-02-02 20:12:40 UTC
From: ia4@cunixa.cc.columbia.edu
Message-ID: <1991Feb2.201240.241@cunixf.cc.columbia.edu>
Source record: 235219
Cross-posted to: misc.forsale.computers,comp.sys.atari.st,rec.music.synth

Keywords: Midi, Software, Immediate Sale, etc.

I have an Atari Mega4 ST 4MB RAM and 30 MB Megafile Hard Drive, with new Atari Hi-Rez mono monitor. It is in excellent condition, sparingly used, and generally a good machine. I say that as over the last few years I have moved from the basic 520ST thru the 1040ST to the Mega4. Each machine served me well and each was sold because I was upgrading.

This Mega 4 was bought expressly to use with my synth and drum machine to create the next great symphony....alas that never happened. :-(I have the original Dr. T's KCS v. 3.0 with Quickscore and rights to upgrades etc.

I used it with a Laserjet IIP (for printing the scores of the above mentioned great symphony!). So I guess that has to go also because it is not a PostScrpt printer. For my use I recently got
the ultimate upgrade, a Mac II fx. The ST looks good sitting next to the II fx but is being used merely to check email. The monitor is even newer than the computer as at one time I had a color monitor that I sold to get this better resolution mono one.

All devices work very well and have never given me any trouble.

I would like to sell the whole combination together if a reasonable offer is made. Or I can sell the computer system and printer separately. But the latter will be sold only if I sell the computer. If I keep it then I will keep the printer too.

The printer has not yet gone through its original toner cartridge (Yes, the symphony was coming along much too slowly :-(

If you are interested then please email me with a reasonable offer. I am not certain what current prices are so cannot make a

1068. Bug in GFA BASIC 2.0 interpreter

Newsgroup: comp.sys.atari.st

I just found a bug in the GFA BASIC (Ver. 2.0) Interpreter. When run from a shell with environment variables set and the environment string is greater than ~280 bytes, an address error message will display when attempting to display alert boxes. Apparently the interpreter copies the environment string and if too long it will overwrite some code.

The version of the interpreter I have is 2.027.

1071. SIMMFIX.PRG Help

Newsgroup: comp.sys.atari.st
Date: 1991-02-03 01:08:29 UTC
From: ekrimen@ecst.csuchico.edu
Message-ID: <1991Feb03.010829.14698@ecst.csuchico.edu>
Source record: 235230

SIMMFIX.PRG a *248-byte* file refuses to run on some occasions. It doesn't run sometimes from the AUTO folder. When I ran it from the desktop to see if it would run from there, I got a TOS Error #35 error (TOS doesn't think it's a program). Sometimes, however, it does run, but it seems to be random. I at first thought that perhaps the fastload bit was set and was causing some problems, but the bit wasn't set.

SIMMFIX always runs first in the AUTO folder. I've also tried it from floppy and I get the same result: sometimes it boots and sometimes it doesn't. Any ideas??

Or, if anyone has a similar program (or a program that just sets _phystop to 2.5megs) please point me in the right direction or send me a copy. Thanks a bunch.

1075. MegaSTe info

Newsgroup: comp.sys.atari.st
Date: 1991-02-03 06:29:24 UTC
From: ekrimen@ecst.csuchico.edu
Message-ID: <1991Feb03.062924.15318@ecst.csuchico.edu>
Source record: 235232

Here's some info on the MegaSTe from Gregory (carter@garfield.cs.wisc.edu).

For those of you who are curious about the new and rather hard to
find Mega STe in the US, here are some performance figures:

Quick Index 1.8

Tos 1.0 Tos 1.4 Tos 1.6
Cpu Memory 165% ---- -----
Reg 205% ---- -----
Divide 204% ---- -----
Shifts 208% 207% -----
Dma 64K Read 5680% ----- -----
Gemdos Files 1583% 1607% -----
Disk RPM 2408 ----- -----
TOS text 121%/536%(Turbo) 386%(Turbo) 342%(Turbo)
string 118%/1911%(Turbo) 1288%(Turbo) 1181%(Turbo)
scroll 181%/195%(Turbo) 140%(Turbo) 110%(Turbo)
GEM Dialog 209%/460%(Turbo) 437%(Turbo) 276%(Turbo)

The MEGA STe is really an awesome machine. Its very fast, Atari has mightily
improved the hard disk controller, I get three times the thruput than
on my old SH204, and the drive itself that came with it is a 157N, a very
nice 50 megabyte hard drive.

Through the VME slot on the back, I popped out the card, and looked inside
too see SIMM's, a nice 90 WATT power supply, and a vacant 68881 socket.
I noticed too, that the, (cannoy confirm have to rip the whole machine
a part which I may do this weekend), but the floppy drive looks like
a 1.4 megabyte drive, sony mechanism. The floppy drive controller
chip is socketed so even though its a WD 1772, it may be easily removed
in the future for a better flopyy controller.

I am a US developer, so I got mine under the wire, ONE LEFT. In fact, there
were only 10 MACHINE shipped to thr US, by developer request. The rest
went to the European and Canadian community. You cannot not NOBODY CAN
get one in the US. If some guy tries to con you, wait till around
April/May, when they should be made available in the US.

The Spectre GCR works very nice with this machine. You get hard disk
performance of something between a IIfx and IIsi. 600-700 kiloBYTES per
second. 33ms access time.

I am very pleased. The retail value of the machine is $1979.99. TOS 2.05's desktop is REALLY NICE, hell, its even USEFUL. It packs HOT KEYS, item grouping which is MacLIKE, very MAC LIKE and command key equivalents. I think much better than NeoDesk. The copy operations are VERY efficient and quick. You can select your own ICONS for different things on the desktop color them, hell even color your windows individually. Now the desktop looks pretty and functional in color!

The Machine has 8Mhz/16Mhz/16Mhz with cache options. YOU should see how SNAPPY this thing is with TURBO ST installed at 16Mhz cache on. You could now use an ST for a very good X Terminal(If youcould find the software).

The keyboard feel is very MAClike. The key tops are smaller so you can type faster and quicker. They are no longer MUSHY. Keyboard is very nicely laid out as far as physical form is concerned. It can mold itself to the front of the cpu housing, for a perfect fit or can simply be place in any position you want. (Its also MUCH better built than the MEGA's old flimsy keyboard design).

The preliminary documentation for the machine is not complete yet. Many of the examples in the documentation manual is a bit misleading. For example, the back of the Mega STe in the documentation is shown to have two fan ports, and the VME slot is labled wrong.

What is also confusing is that the mono mode indicated in the manual says two colors are available on the MEGA STe, from a palette of 4096, at 640x400?! I of course can't test this as I only have the SM124 to work on.

I am very satisfied with the layout of the machine, the reset key is in an easily accessable location, along with the keyboard port, which makes positioning the keyboard much more intelligent than on the MEGA ST machines.

Now here is the port listing from the DOCS:

Processor: 16Mhz 68000

Math CoProcessor 68881/2(Optional)

Memory 2 or 4 Depending on Model

Graphics 320x200x16
640x200x4
640x400x2

Color 4096 Colors

Interfaces Midi IN/OUT

VME-compatible Eurocard
(Comes filled/Serial Port)

Monitor port (RGB)

Television port

Parallel port

1 Serial Port

2 Modem(RS232C)

Floppy disk port

LAN Interface

ACSI DMA port
(10 Megabits per second)

ROM Cartridge port
(128K)

Mouse/Joystick port

Stereo RCA ports

Sound Generator Pulse Coded Modulated
sound (8bit DA Converter)

3 voices from 30Hz to
above audiable range

Keyboard 95-key intelligent
keyboard using its own
microprocessor.

Power Consumption 95 WATTS MAX.

Physical characteristics Hieght: 3.54; Width 19.29
Depth 11.41

Message-ID: <1991Feb3.164633.28223@cns.umist.ac.uk>
Source record: 235001
Cross-posted to: comp.sys.mac.misc,comp.sys.ibm.pc.misc,comp.sys.atari.st

Having replaced my Atari ST with a Mac Classic, I need a way of getting my lecture slides from Gem format (actually EasyDraw, but fairly similar) to the PICT format used by Macs - we've got SuperPaint, but if I could convert it to MacDraw format that would suffice. Note I am only interested in the object files, and not in the bitmat (.IMG) stuff. Has anyone got such a program - it doesn't really matter which machine it runs on, since we still have the ST's around. Alternatively, we have access to many flavours of Unix.

I hope someone knows of something, because I'd be loath to type it in again!

Thanks in Advance.

I just started using Spectre GCR (V 2.65C) and I find that some software thinks my Hard Disk partitions are floppy disks (I tried the HD backup software that comes with the system disks and it said it couldn't find any SCSI devices). I also tried to install MPW using the MPW installation procedure and it kept telling me to copy it to the Hard Disk (which is where it was).

Any body else run accross this? Am I missing something in the manual?

Try getting a track ball. Once you remove your hands from the ball the
cursor doesn't move. One comment about the "Best Trackball" (thats the
brand name) though.
It has a tendency to start moving on it's own when the ball stops in
certain places all you have to do is roll the ball a bit to get it to
stop but it can be annoying sometimes ('course sometimes it's cute).

1084. TOS 1.4 upgrade problem

Newsgroup: comp.sys.atari.st
Date: 1991-02-03 20:54:59 UTC
From: wschou@waikato.ac.nz
Message-ID: <1991Feb4.095459.2883@waikato.ac.nz>
Source record: 235238

I am tried to get a TOS 1.4 ROM upgrade for my 1040STF with TOS 1.0 but
was told my board revision would not accomodate it.
I opened my ST up to check this out and found 6 socketed ROM chips with
C070523-001 REV. C printed on the board.

I have heard there are 4-chip and 6-chip upgrades available and it could
be the dealer it was sent to did not know about the 6-chip set.

Has anybody else had similar problems or should I go ahead and buy the
6-chip set (from somewhere?) and install it myself (you only need to
replace the ROM chips don't you?)

Thanks for any advice
Wayne Schou

1086. Overscan in monochrome

Newsgroup: comp.sys.atari.st
Date: 1991-02-03 21:31:47 UTC
From: mrose@libserv1.ic.sunysb.edu
Message-ID: <1991Feb3.213147.24259@sbcs.sunysb.edu>
Source record: 235246

Hello everyone!

The most I have been able to overscan on my sm124 monochrome
monitor has been 672x480. If I set it to overscan more, the image
becomes bent and wraps around the screen. In the overscan docs, it
mentions that it is possible to overscan approx. 800x600 (I think) on a
well adjusted monochrome monitor or a multisync. Does anyone know what
adjustments have to be made to the monitor to do this? What is the highest
resolution anyone has been able to overscan on the Atari monochrome or
multisyncs for that matter?
I was also wondering if anyone has seen or knows anything about
the Reflex graphics board for the Mega's. It is a plug in card that
is supposed to provide 1024x768 on the standard Atari monochrome monitor
and even higher resolutions with other types of monitors. Does anyone know
if it is available in the United States? Thanks!!!

Sincerely,

Michael Rose

1087. How to get Elvis to work?

Newsgroup: comp.sys.atari.st
Date: 1991-02-03 21:32:20 UTC
From: rcb@netcom.UUCP
Message-ID: <22704@netcom.UUCP>
Source record: 235242

This may sound silly, but has anyone out there gotten Elvis to work on the ST? My problem is that, when I invoke (provoke?) Elvis, I always get the message 'unrecognized TERM type'. I am running with Gulam v. 1.04.05 with the TERM variable set to 'st', the TERMCAP variable containing the termcap entry for 'st' and an \etc\termcap file with an entry for 'st'. This same setup works with GNU Emacs and the recently-posted less v. 97 (and no, I'm not running Mint either!). I got my version of Elvis from panarthea. Any ideas? I even tried to run without the TERM variable, just got kicked out again with 'TERM variable must be set'. Talk about Catch-22!

Thanks for any help,
Roy Bixler

As I understand it, there's a 2 chip set and a 6 chip set.
For months, my dealer has been waiting for ATARI to send them
6 chip sets of 1.4. I HAD been waiting for ATARI until I found
out that JOPPA had both sets. They each sell for $89.00.

When i got mine, ATARI had supplied ONLY a sheet of paper
diagramming Mega boards.. so i had to guess as to which
orientation to set the roms. As it turned out, by following
the "logic" of ATARI's STICKERED chips (and not following the
more intuitive labeling of the chips underneath the stickers,
i put them in reverse order). NO harm done.. just reoriented them
and everything has been perfect.. except that i had to drop
my ST from about 2 inches off the table a couple of times
to get it to boot. I haven't had to do that for a month now.

1089. System + Software for sale

Newsgroup: comp.sys.atari.st
Date: 1991-02-03 22:45:25 UTC
From: fer9483@tesla.njit.edu
Message-ID: <1110@tesla.njit.edu>
Source record: 235031

I have the following for sale:

Atari 1040st CPU w/DS drive
Atari Color Monitor

and the following software (all originals, MOST with manuals)

Return to Genesis
Populous
Scrabble
Dungeon Master 2, Chaos Strikes Back
Road Raider
Virus
Hunt for Red October
Heroes of the lance
Gauntlet
Star Trek: The Rebel Universe
Space Cutter
Bermuda Project
Rockford
Cosmis Relief
Elite
Outrun
Mortville Manor
Obliterator
Slaygon
Star Wars
Gold Runner 2
Universe 2
Empire Strikes Back
Tracker
Shadowgate
Fire and Forget
Legend of the Sword
Warlock
Pandora
Ice HOckey
FLight Simulator 2
Leatherneck
Gunship
Road Wars
Alien Fires
Paladin
Hostage
Bionic Commando

Micro League Wrestling
Jet
Questron 2
Alternate Reality:The City
Autoduel
Bard's Tale
Carrier COmmand
Chronoquest
Captain Blood
Knight Orc
Foundation Waste
Sentry
Breach
Gold Of The Realm
Empire
Space Quest
St-Talk

Thats 55 games, if I sold them for $7 a piece (which is very reasonable)
that would be $385 , I will sell the whole package, 1040, monitor + all
software for $750 or BO.
I must sell as a package.

Please Email me, or better yet, call 908-276-9667.

There are two sets of chips available of TOS 1.4. There is a 2 chip for the original MEGAS and a few 1040's and a 6 chip set for everything else. There is no reason why you can't use the 6 chip set. Were you going to have him install it or were you going to? He might have not wanted to sell you a set if he wasn't going to make any profit off it...

Anyone who uses an Amiga in 640x400 or greater has a de-interlcing card
or runs in productivity mode, 640x400x4.

Try doing 1280x512x2 on an ST with NO extra hardware, it's not possible,
it is on an amiga.

>Try to do anything usefull in an unexpanded amiga while displaying a 640x200
>x16 , extra-halfbright pic. More than 2 planes at 640*200 (which is the
>same as amiga 640x400) in an 8 MHz 68K system will require cpu cycles to

The Amiga's graphics are far superior to the ST for speed and it's a well
known fact.

>acquire video data. In the more colourful video modes you have to run your
>CPU in the intervals.
>
>This is why amigas have limits on video ram. ST's have no limit on video ram

Cross-posted to: rec.music.synth,comp.sys.atari.st,misc.forsale,purdue.forsale

Hello all!

I just got rid of my Atari ST to a non-musical person and have two pieces of
ST software for sale:

Hybrid Arts SmpteTrack II professional sequencer
- Version 5.0, 1989
- 60 tracks
- Graphic editing
- Includes sync box for SMPTE, FSK, TTL, DIN, HybriSync, Audio Click
and/or MidiTrack II/III input and output
- Lots and lots of very nice features

Hybrid Arts EZ-Score Plus notation package
- Professional sheet music printing program, 1987
- Auto-score from SmpteTrack files!
- Lyrics support
- MIDI or speaker playback
- Very ergonomically designed
- Perfect complement to SmpteTrack

The last time I checked, these were going for around $350 and $120,
respectively, but all reasonable offers will be considered!

- Jon

>a quick 'n' easy way to upgrade a TT to 68040 without compatibility
>problems? Now that would be a neat trick!!!!!
>
Well, first to address why Atari didn't put a 68040 in the TT. First,
the original TT was based around a 68020, however, Atari realized that it
would be hopelessly outdated by the time it got to market. So, Atari took
the gamble that the 68030 would be available in mass quantities when they
got the TT to market. The 68040, however, is still not available in large
quantities from Motorola and is extremely backlogged. So, right now the
68040 is not feasible. Think about it, if Atari was wrong, David Small
would not be messing with a 68030 board, he would go 68040.
Okay, here I am a little shaky... I wouldn't imagine that the 68040 would
be difficult to implement in terms of an upgrade, apprently Atari got TOS
into a state where it is hardware independant (thus the increase in size).
Therefore, I would think the 68040 would have no problems...

Just my humble opinion....

Kurt Mosiejczuk kurt@nick.csh.rit.edu

1100. usenet news/mail software

Newsgroup: comp.sys.atari.st
Date: 1991-02-04 10:21:30 UTC
From: eric@abode.wciu.edu
Message-ID: <1991Feb4.102130.328@abode.wciu.edu>
Source record: 235008

The version of the usenet news/mail software that was sent to my system last week was not functional. Is there anyone out there who is running this software on the ST? If so, would it be possible for you to encode it and send it to me (in pieces since I know it is over 60k).

Did anyone else succeed/fail in trying to get the binaries that were sent to comp.sys.amiga to work?

I don't personally use an Atari ST (I got the file for a friend of mine). But, from what I was told from the person I gave the file to, was that it did not uncompact from its .lzh format once it was decoded.

Any help would be appreciated.

I don't normally read this newsgroup so please respond by mail.

Eric

1101. Re: Using GDB

Newsgroup: comp.sys.atari.st
Date: 1991-02-04 11:50:42 UTC
From: gjh@hplb.hpl.hp.com
Message-ID: <GJH.91Feb4115042@ghiggins.hpl.hp.com>
Source record: 235028
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Ron DiNapoli writes about using GDB:

```
++ I get "Program terminated with code #ffffff95" (again, not sure of the
++ number).

++ Does anyone know how to create good symbol files and good executables???
++ I can't use the -mshort flag because I need to have 32-bit ints (if that
++ makes a difference).
```

I've seen both problems experienced by Ron DiNapoli. I've recently been trying to port Elk (a Scheme implementation) to the ST. It compiles up but bombs out with a bus error (2 bombs), so I tried using jrd's GDB to debug it.

First reports of GDB indicated that it wouldn't work with GCC 1.37.1, later reports suggested otherwise.

My own experience suggests that GDB works fine on the set of test data supplied with jrd's GDB port. However, I've not managed to get it to work properly on the compiled Elk code.

I am currently oscillating between gulam and ksh-under-mint. (The Elk code tests the executability of argv[0], for some reason it can't find anything there under gulam but can with ksh, anyway ...)

GDB crashes out under KSH when reading symbols from the sym file. Scratch one route. Under gulam, it reads the exec and the sym file OK, arrives at the start after "run", reports "info functions", etc fine, but either 2-bombs out on "cont", or reports "Program terminated with code #ffffff95". Once, I got it to "cont" but it wasn't behaving *anything* like the way it does with the (precompiled) test code set. I chased down Edgar Roeder's uni-sb version of GCC, which has been reported as supporting GDB. Didn't seem to make much difference.

CFLAGS were:

```
-gg -O -DGEM -D__NO_INLINE__ -mshort -fcombine-regs -fstrength-reduce
-fomit-frame-pointer
```

are any of the above flags inimical to GDB?

the .ttp and .sym files were produced ..

```
gcc-ld -o scheme.ttp c:\gnu\lib\gcrt0.o $(O) -lpml16 -lgnu16
sym-ld -r -o scheme.sym c:\gnu\lib\gcrt0.o $(O) -lpml16 -lgnu16
```

I am using crt0.o and gcrt0.o assembled from the .s files distributed with Eric Smith's Mint libraries. The Mint libraries are not linked in to the Elk code.

Grateful for any suggestions.

BTW, when GCC compiling under gulam, "make" seems to 2-bomb out after some arbitrary period of happy mass compilation, ditto Ksh but less frequently. Under Ksh, problem seems to go away after the third/fourth round of mass compilation (with -g, without -g, with -gg, without -gg, ad nauseam) but return after a warm boot. Anyone shed any light on this --- I have a suspicion that it's a malloc() problem, but it's outside my field.

Cheers,

Graham

Are we back on this again? "Gosh, golly Bitman. They can't seem to help themselves..."

>The Amiga's graphics are far superior to the ST for speed and it's a well
>known fact.

Yeah, we know Amiga has better graphics but I wouldn't go so far as to say superior. I don't know about speed either. Did anyone know that all STe's (any flavor) are genlock ready? Just send a video signal and go. STs [also] have "add on" boards, just like Amiga's do, that provide megapixel color graphics. Since the ST is a common person's machine, the idea is [I guess] that most people don't need 24-bit 2k by 2k graphics. Although I'd settle for a slight increase in rez and color :-) I can live without it though. If it's ever needed, I know it's available and supported by some really cool software. The TT of course, has many nice color graphics modes and a mono megapixel mode, without extra hardware.

My machine is simply wonderful at doing MIDI and stereo sound (50MHz digital, PCM, and standard 3 voice sound chip). I'm a wanna be musician and the Mega/Ste is everything I could want at a price that Commodore currently isn't close to touching. No, this isn't a challenge for people to start listing prices and specs. Given the market at this time, I couldn't overlook the "Atari Advantage." When I integrate computer video with my next MTV hit, I'll get an 030 Amiga and a toaster.

>ps. How about multi-tasking on an ST ?? Impossible.

Not quite. Depending on what you want to do you can have multitasking that is based on I/O waits, interrupt level, both, or simply process swapping. Several veratile schemes exist with one even being supported by Atari. It is possible, for example, to compile in one window, use a Bash shell to watch the progress, and edit another file. The 68000 as used by Apple, Atari, and Commodore doesn't have a [good/any] MMU scheme, so individual processes aren't protected from each other. Sure the 68020/30 offers this and all three companies sell such beasts, so "true" multi-tasking can be had by all.

Oh yes, just in case anyone's toes were bruised, I feel obligated to: [Soapbox mode off] :-) :-) :-) :-) :-) & ;->

1116. All about TOS 2.05 / New Desktop / Mega/Ste

Newsgroup: comp.sys.atari.st
Date: 1991-02-04 14:54:38 UTC
From: gaudreau@juggler.East.Sun.COM
Message-ID: <4165@eastapps.East.Sun.COM>
Source record: 235024

Howdy,

Since there has been a lot of interest lately in the Mega/Ste line, I figure it's time to add my two cents worth. Being a developer, I really wanted one of these machines, so I went for it and the machine arrived on the 22nd of January. A day to remember fondly :-)

Gregory Carter has recently given a good overview of the hardware and hopefully, he'll tear his machine apart and let us know more about it. Since software is my main bent, I'll describe the new desktop features of TOS 2.05.

General details of the machine include a "wedding cake" box (it's not a pizza-box). The case is the standard Atari grey which matches the SF314 floppy drive and the new SC1435 stereo color monitor. The CPU box is really quite attractive and I'm very pleased with the way it turned out. In all ways that I'm familiar with, the Mega/Ste looks just like a TT. The only details that may differ are: Color of letters on the keyboard is dark Navy blue (TT is reported to have green keys) and the mouse ball is grey (TT has white?).

Other details: The keyboard is excellent. It is somewhat like the new keyboards found on Sun Microsystem's Sparcs. Pretty nifty since I use a Sparcstation daily. The CPU box has a nice fan which isn't too loud and hopefully will keep things cool. The top of the case is WELL ventilated, as is the HD section. I should point out that the smaller part of the CPU box contains the HD, which is supposed to be a Seagate 157N, 48.6 MBs. No known specs on ms. Atari has recently upgraded the HDX software to version 402. While the Mega/Ste HD is shipped formatted, partitioned and ready to go, mine didn't come with the HDX utilities (you still need to install the HD), so I had a few days wait to get them from Atari. The tech support crew were very helpful in this regard.

The VME port is vacant on my machine although the slot cover has been used to add the serial 2 connector. Something would have to be done if ever a card is added... The serial 2 and the LAN port are one and the same, even though there are two different connectors, I'm told that they cannot be used simultaneously. Hmmmm.

Right now, the desktop. Looking from left to right, the pull-downs are as follows: Desk, File, View, Options. There is also the new control panel under Desk and the help key menu.

Desk -
Desktop Info...

...various .acc as usual
Control-Panel

File -
Open [O]
Show Information... [S]
Search... [L] Searches thru all selected devices for filename,
wild cards work.

Delete Item [!]

Create Folder [F]
Close Directory [B]
Close Top Window [C]
Bottom to Top [W]
Select All Items [E]
Set File Mask [X]

Format Floppy Disk

View -
Show as Icons [9] *
Show as Text [0] *

Sort by Name
Sort by Date
Sort by Size
Sort by Type
No Sort

Size to Fit

Set Color & Style

Options -
Install Icon Select your choice of icon for device, file, etc.
Install Application... Install an application to desktop (&/or func key)
path names, auto boot, tos/ttp/gem/prg, args, doc
type, default dir, parameter (full or local file
name), etc.
Install Devices
Remove Desktop Icon [R] Includes anything you can drag onto desk top. It
is quite cute to have emacs on the desktop, drag
a file on the icon (which looks like a pencil &
paper - thanx to TOS 2.05) and edit it. Emacs
knows where to look for its startup files due
to install application default dir.

Set Preferences... Confirmation for delete, copy, overwrite, and
of course, low, medium, and high.
Read .INF File... Allows for multiple .INFs for different rezzes,

work styles, and projects, etc...
Desktop Configuration [M] Global settings for default dir and parameter
(these are over-ridden by install application),
Function key assignments (view or edit from
install application, or whatever you like),
Define single keystrokes for anything that is
on menus... Change, clear, etc., show free
mem.

Save Desktop [V]
Print Screen

Blitter

* ==> Keys that I assigned (ie not default).

The [HELP] key gives you two boxes of text:
[ALT]+Open Folder - Open new folder into a new window
[CTRL][?] - Replace top window with drive ?
[ALT][?] - Open drive ? into a new window
arrows - Scroll window contents
[ESC] - Update top window
[HELP] - Show help menu
[UNDO] - Stop any file operation
[CTRL][ALT][RSHIFT][DEL] - Cold boot
[CTRL][ALT][RSHIFT] - Warm boot

[CTRL]+Drag Files - Move files
[CTRL][ALT]+Drag Files - Move and rename files
[ALT]+Drag Files - Copy and rename files
[ALT][HELP] - Screen dump to printer
[ALT][1..6] - Change resolution [No the Mega/STe doesn't have 6 rezzes
normal 3, extra 3 for TT :-(]
[CR] - Deselect all items
[>] - Print top window contents

The Control-Panel is pretty slick. It has the following features:
o Shows time and Date
o Options/About
o Options/Setup - 12/24 hour time display, # cpx slots, cpx dir
o Color Setup - RGB sliders define what color you have for this rez on
the desktop (2/4/16 for high/medium/low).
o Configure CPXs - Text/Icon color, RAM resident or not.
o General Setup - Status TOS version 2.05, TOS date 12/05/1990, free ram//
Set response rate, Set repeat rate, Set mouse click speed, blitter on or
off, CPU speed (8, 16, 16 w/cache).
o Mouse accelerator & screen saver/black-out (with modem activity setting).
o Modem stuff - the usual.
o Sound - L/R balance, bass, treble, volume
o Window Colors - 16 color windows in low - anything about window can be
set, only 4 colors in medium, but it looks cool, change the color

and pattern for almost everything. No more icky Atari green. There might be a way to set individual colors for each icon on the screen but I haven't figured out how (yet). Anybody?

Disk operations seem a lot faster than what I was used to with TOS 1.4. The disk copy operation (I tried it once, okay? :-) reads the whole disk into memory before writing it out. File copies are read file by file but the whole file is read.

With this "new" TOS/desktop, I have to wonder why I'd want to run a replacement desktop (that's not to say that they aren't handy for some). TOS now functions in a way that is useful, which is a treat to say the least. F10 has Gulam-*07 hooked into it for any shell things I want to do, F9 is hooked into Emacs 3.10s (which is also pretty cute) and also tied in as a desktop icon. I suppose I'll put Turbo-C onto F8. With the new key mappings and such, you don't have to touch the mouse if you don't want to. Being used to Emacs, using keyboard accelerators is quite natural and desired. Nice move by the Atari programming crew.

Now only if I could run Star Raiders... Oh yes, as far as problems with TOS incompatibility, I have run across a few programs that don't play nice, but overall I'm not worried by it.

Joe

640*400 only in flicker mode (Interlaced)
Try to do anything usefull in an unexpanded amiga while displaying a 640x200 x16 , extra-halfbright pic. More than 2 planes at 640*200 (which is the same as amiga 640x400) in an 8 MHz 68K system will require cpu cycles to acquire video data. In the more colourful video modes you have to run your CPU in the intervals.

This is why amigas have limits on video ram. ST's have no limit on video ram except the inherent ST memory limits this makes frame animation much easier on an ST.

TeX is a complicated package with many distinct parts. Get someone
who knows what he's doing to help you bring it up. And buy "The
TeXbook" by Donald E. Knuth and the "LaTeX User's Guide & Reference
Manual" by Leslie Lamport, both published by Addison-Wesley.
You might also want to join the TeX users group and/or start reading
the national newsgroups arpa.texhax and comp.text.tex.

To answer your specific questions:

IniTeX is used to turn macro packages such as LaTeX into .fmt "format"
files. (The format file for LaTeX is called "lplain.fmt".)

VirTeX reads format files and then processes your .tex file. Thus,
LaTeX in many systems is just a shell script to run VirTeX with
"&lplain" as its first argument.

LaTeX uses a database of "style" files---files with .sty suffix.

TeX/LaTeX also need .tfm files which describe the various fonts
available. (These are generated by Metafont---see below.)

VirTeX uses various environment variables to locate its files. It
read its .fmt, .sty, and .tfm files while processing your .tex file
and produces a "device independent" .dvi output file.

.dvi files can be viewed on the screen or printed on various kinds of
printers if you have the appropriate .dvi driver AND the required
raster fonts ".pk" files. By themselves .dvi files are pretty
useless.

MetaFont is the program for generating .pk and .tfm font files from
.mf files (which describe the font in an abstract way). If you have
to generate your own printer or screen fonts, then you have another
big job ahead of you, and you will want to buy the Metafont book, also
by Knuth and available from Addison-Wesley.

Hope this helps.

1119. AMIGA Specs

Newsgroup: comp.sys.atari.st
Date: 1991-02-04 16:33:42 UTC
From: carter@cat27.cs.wisc.edu
Message-ID: <1991Feb4.163342.22821@daffy.cs.wisc.edu>
Source record: 235041

There are a number of reasons why you can't compare the AMIGA 500/2000
even though they have comparable processors.

Probably the biggest point I can make on this matter is that the AMIGA
has more capable display hardware, that is true, but the STe has more
capable connectivity hardware built into it right out of the box.

Just from this fact alone, the ST and AMIGA are targeted for two very different
markets.

>>acquire video data. In the more colourful video modes you have to run your
>>CPU in the intervals.
>>
>>This is why amigas have limits on video ram. ST's have no limit on video ram
>>except the inherent ST memory limits this makes frame animation much easier
>>on an ST.

>There may be a physical limit to CHIP ram, but all the serious 8Meg
>Sound/Animation players use bank switching, it's not a problem at all.

Well, this is really absurd, 8megs, your already WAY out of the ST's
ball park in far as memory capacity and price.

As for GEM being a complete turn off, I WOULD have greed when I had TOS
1.4, I WOULDN'T agree now that I have TOS 2.05. GEM is VERY functional.
Personally, I thought the same when I seen the WORKBENCH pop up with
its color thought bubbles everytime you wanted to run something.

Yes you can do multitasking on an AMIGA 500/2000, YES in my personal opinion
and experience, I think it is TOO slow. An 8Mhz 68K processor is just
not that great for multitasking that much.

Not only THAT, you IDIOT, but GEM on the PC and GEM on the ST are TOTALLY
different beasts.

--Gregory

PS: NO, multitasking can be done on an ST, you haven't been reading up on our
machine, your a fool, and you don't know what your talking about.

From: <>
Message-ID: <11888@darkstar.ucsc.edu>
Source record: 235021

It seems that nearly all of the files at the terminator ftp site now are compressed with the .lzh extension. I think that is fine because I have no problem downloading shorter files but I do have one problem: I cannot find a lharc program for UNIX so now I cannot see what it is I am downloading before I download it like I could when they were ARC files. Does anyone know where or how to get a LHARC program that will run under UNIX so that I can read the README files and not waste too much time? I would appreciate any help on this matter.

I can strongly recommend Falcon. Various degrees of difficulty. Quite realisitic Optional mission disks and my favourite Head to Head (over modem or using a null modem cable at 19.2K Baud). My brother and I have played this and it is truly a blast. F-19 is also quite a good game as well as Their Finest Hour. If you want jet bombings/dogfights go with Falcon. If you want more strategy and stealth get F-19 and if you like older planes with the option of flying an assortment try Their Finest Hour (great replay option). As an aside you might look at Gunship (Apache helicopter) and the rumoured Gunship 2000 (a selection of helicopters).

From: d90-ngp@sm.luth.se
Message-ID: <1416@tau.sm.luth.se>
Source record: 235045

Hi!
I have three questions concerning Signum 2!:

1) Are there any way to convert a document written in Signum 2! to TEX?

2) How many different fonts do I need to write all possible scientific and mathematical symbols (including matrixes etc)?

3) I haven't managed to find any retailer for Signum 2! in Sweden, so I,d like to get some tips about reliable retailers in other countries which can export Signum 2! and some scientific/technical/mathematical fonts for a reasonable price.

1124. Having problems with my Spectre GCR

Newsgroup: comp.sys.atari.st
Date: 1991-02-04 17:03:57 UTC
From: pavneet@klg.UUCP
Message-ID: <123@klg.UUCP>
Source record: 235025

Hi,

Ever since I purchased my Spectre cartridge last year, I have had problems with it reading Mac floppies. I have run gcrtest a number of times and I get different read/write failures each time. Has anyone else had these types of problems? (I had sent the cartridge back to GBS to let them have a look at it. They returned it saying that it tested fine on their machine, which is probably true, but doesn't help me any.)

I haven't had any problems with my floppy drive in any other way, but I guess that Spectre stresses the floppy a little more.

I'd be grateful for suggestions/opinions.

advTHANKSance

1128. advice please - Atari-ST or Amiga

Newsgroup: comp.sys.atari.st
Date: 1991-02-04 17:52:52 UTC
From: rick@tetrauk.UUCP
Message-ID: <1084@tetrauk.UUCP>
Source record: 235030
Cross-posted to: comp.sys.atari.st,comp.sys.amiga.misc

I suspect this could be a religious issue for some people, but as an agnostic on the subject I'm just looking for a bit of objective advice.

I'm planning to buy a system for home use, on a small budget, and the Amiga and Atari systems look pretty much comparable to me. What I'd like to hear are any more subtle insights into which (possibly neither!) is more likely to suit me better, especially in the long run.

Just so you know what level to pitch at, I'm a professional software engineer and systems programmer, working on Unix on anything from 386 top-end PC's upwards. The home machine is going to be used mostly by my family (I like to take a break from the things when I get home :-). If I had the budget I'd get a nice 386 Compaq with plenty hard-disk or similar, but I haven't - sigh.

Likely uses:

Games playing, mostly by the children
WP, my wife and myself a bit (I'd probably be happier with a vi clone!)
Household accounts
By my wife (an accountant) to handle client accounts
this is fairly small-scale, and I'd anticipate adding hard disk, etc
(I'd probably want to write s/w, or adapt PD stuff for these last two)
By children to learn programming, and "real" computing
Datacomms - remote login to the office, etc. (even Usenet!)

Things I'd like to know about:

What you REALLY get for the price with the cheapest model - any "optional extras" that you can't really live without.
Relative costs of upgrading RAM, adding disks (floppy and hard), printer and comms interfaces.
Limits to such upgrades (max RAM, max MB disk, etc)
Video quality a) via TV modulator, b) using monitor.
Costs of monitors, including availability of 3rd party monitors.

What's the standard OS, and how useful (and easy to use) is it?
What alternatives are available (both commercial and PD)
Availability of software - games, packages, programming languages (interpreters & compilers), teaching aids, etc.
General quality and relative prices of such.

Any significant performance comparisons.
Anything you think is significant that I haven't mentioned.
Why I shouldn't get either and get something else :-)

I'd like to be able to start small but have the option to expand if I feel it's justified, so the point at which the cheapest machine becomes a dead-end is important. I know the Amiga comes in various models, but I'm not clear what upgrade there is, if any, between them.

I'd also appreciate any advice on low-cost letter-quality (even graphics) printers that would be suitable. I have very little experience at this end of the market.

Please bear in mind I live in England, so any super bargain deals available in the US aren't going to help me much! And from anyone in the UK, comments on the chances with either system of getting a good second-hand deal would be welcome (from a quick scan of the newsgroups, I suspect the Atari has the edge here - presumably as it's been around longer).

Please respond by e-mail, as I don't generally follow these newsgroups.

Thanks in advance

1129. Sozobon C and dstart.o <==> Ram Disk

Newsgroup: comp.sys.atari.st
Date: 1991-02-04 18:33:44 UTC
From: swood@terminator.cc.umich.edu
Message-ID: <1991Feb4.183344.12478@terminator.cc.umich.edu>
Source record: 235032

I have just gotten my Sozobon C set-up going, and I am having a lot of fun with it. I thank all of you for the help and suggestions with getting it going. However, I was noting that with my single drive set-up, the thing works very slow, so instead of adding my libraries to the ram disk, I am trying to get my bin directory to work from there. I noted there-after, that the cc program was unable to find the dstart.o file that is usually in the sozobon/lib directory.
For a background to what I have set up, I am using gulam as a cli, and I am using a file called sozo.g to copy the sozobon bin directory and the sozobon lib directory into the corresponding directories in my RamDisk (H:) that I set up with rambuffer.acc. I then set paths to h:\sozobon\bin,h:\,a:\,. and do my work from the a: drive. the ue works fine for my editing, and then cc main.c gives me the error that it can find the dstart.o file. I tried cc -IH:\sozobon\lib but that returns the same result.
I have discovered that if I move to the H: drive, and compile the file in the a:\drive from there, it does work (cc a:\main.c) but it is a bit annoying, and I would hope that it may not be necessary to do this.

thanks in advance for the help...

swood

1130. Re: MSDOS formater

>(except serial number), a compatible media byte, the FAT and the root
>directory should have the same length and it should write the same number of
>FATs as on MSDOS disks. Is there such a beast around?

I looked recently at the code for "IBMFMT" by Moshe Braner. If I understand what is being asked, I think that this is exactly what Moshe has done. Both the code and the program have been posted, so I think you should find them both at "panarthea" and "terminator". The site "panarthea" is the one from which all our binaries and sources are posted to the net, and it is a mail server. The site "terminator" is now becoming known as "atari.archive.umich.edu", and it is both a mail and an ftp server.

Another program of the same nature is "ps2form". I think that it is about the same, putting in the random serial number and writing a binary image of a DOS 3.3 boot sector. There is some subtlety about just what is done first that makes this different from "ibmfmt", but the effect is the same.

Both of these program are free.

1131. 1040ST/mono for sale

Newsgroup: comp.sys.atari.st
Date: 1991-02-04 19:23:40 UTC
From: glenne@hpnmdla.HP.COM
Message-ID: <810025@hpnmdla.HP.COM>

I have my ST hardware and software for sale.
Included is:
my 1040ST, 1 MByte ram/builtin DD 3.5" drive
monochrome monitor
mouse
mouse pad

in original boxes. Hardware is about 4 years old (as I remember).
With the exception of the ST power supply, which finally had to have
all of its aluminum electrolytic caps cslanged (Wang'sCap was vendor
on all the bad ones), it has performed and still performs flawlessly.

also includes:
Laser C Compiler(I forget the version but I've received one update)
EasyDraw (early version)
WordWriter ST

Reason for selling is that my defenses against IBM/Intel architecture
have finally been broken down and I'm doing schematic/pcboard development
in that environment for lack of an alternative. I like the ST hardware
and architecture way better, I just can't fight PC land any longer (:[

I'll UPS in US for $375.

Flight Simulator II from Sublogic has _no_ protection and can be hard disk
installed. I saw a new one last week at B&C Computervision in Santa Clara,
Proflight from the U.K. Big, heavy box, looks incredibly feature-packed,
mono or color. Lets you be many planes, from Cessna to Tornado (recreate
the Gulf War!), don't know about protection. $64.95 I think.

This from the same guy that called Allan Pratt an IDIOT, and even after a rational explanation of what a disk cache was, still wondered why his hard drive didn't go any faster.

When did the University Of Wisconsin CS Department start accepting 7 year olds?

1141. Re: Tex/LaTeX & *.sty files..

Newsgroup: comp.sys.atari.st

From: rosenkra@convex.com
Message-ID: <1991Feb04.221451.854@convex.com>
Source record: 235048

this was the first understandable description of TeX/LaTeX i have seen. i had to run that sucker once, a couple of years ago, on a sun, and have totally abandoned it as one of the poorest documented huge systems around (much worse than something like NASTRAN, for example). personally, i stick with troff, since it is trivial to use by comparison for simple documents. TeX may be superior for doing books, but it really is horrible to get up the learning curve just to write a simple letter (since it takes a week just to install the damn thing). part of the problem is there does not seem to be a really simple explanation like what was just posted. you are stuck with reams of docs to wade thru. i tried to figure out the docs for the ST version some months ago (before 3.x was available) and gave up after several hours of wading thru docs written in the format which must be read only after the system was installed (kind of like posting an executable of an archiver in the format of that particular archiver :-( ).

maybe it is just the installation instructions on the ST that are rather sketchy, so don't all u jump on me for loosing it :-). still, it seems to me that a system as complex as TeX should have a README with at least this sort of minimal introduction, so that from the first step, a user/installer has a somewhat global view of how the system works.

thanx to michael fisher for this clear, thumbnail intro. people reading that description can probably save a week of frustration...

For Sale: Atari 520stfm. Only used a couple of months.
Mono Monitor
extra 354 SS DD Disk Drive.
Lots of PD Software.

$450.00 Or Best Offer.

Call 415-428-1007 or email this account for more details.

1143. AES when resolution changes ?%@^&%

Newsgroup: comp.sys.atari.st
Date: 1991-02-04 23:45:53 UTC
From: warwick@batserver.cs.uq.oz.au
Message-ID: <7164@uqcspe.cs.uq.oz.au>
Source record: 235050

I use the XBIOS SetScreen funtion to change the resolution from medium
(for program editing) to low (for program execution). However, any Alert
boxes I pop up are still centred in the screen AS IF IT WAS STILL IN MEDIUM
RESOLUTION!

How do I get around this problem? (I am using TOS 1.0, I think)

Stumped.
Warwick.

ps. I also change between Mono and Colour (by trapping the monitor change
interrupt), and have a similar problem.

Message-ID: <4951@umbc3.UMBC.EDU>
Source record: 234955
Cross-posted to: misc.forsale,comp.sys.atari.st

I have two 520ST CPU units for sale:

Unit 1 has 2.5 megs (Z-RAM upgrade) $350
Unit 2 has 1 meg (Piggyback RAM) $250

Units include mouse and power supply, and also have RF modulators built-in.
NOTE: These units do not include disk drives.

These prices are ASKING prices. If you want to haggle, go ahead! I love
a good barter session. If you have some hardware to trade, go ahead and
offer that as well. I'm looking for Atari ST and IBM equipment at the
present time.

If you are interested, just drop me a line at my signature address or call
me at (301) 455-1506 for the personal touch.

Thanks!

Source record: 234960

Hi Matt,
You asked "Are all Atari hard drives this so? 33ms?"; no they
are not. It is not an Atari hard drive, it is a Seagate ST157N in an Atari
computer. Put in a better drive like a Conner or a Quantum and you would
instantly see better access and data transfer performance. HD performance on
the Atari is affected by both the host adapter and specifications (average
access time and data transfer rate) of the particular HD mechanism. Bye.....

From: neil@cs.hw.ac.uk
Message-ID: <2089@odin.cs.hw.ac.uk>
Source record: 234967

What is the current copyright status of NEOchrome? Is it Public Domain or what?
My ST came with version 0.5 free on the language disk. I believe that
version 1.00 was on sale in the UK some years ago (for ~15 pounds).
Now I see it advertised by Public Domain libraries.

If it is Public Domain, can it be packaged as a 'Free Public Domain Disk'
with a commercial program?

Not only that but I have see a completely decompiled/disassembled and reworked
version of NEOchrome that contains many, MANY, new features. What is the
legality of doing this with the original program and how does it affect its
distribution?

>>640*400 only in flicker mode (Interlaced)

>Anyone who uses an Amiga in 640x400 or greater has a de-interlcing card
>or runs in productivity mode, 640x400x4.

Productivity mode only comes with the A3000 which means a rather hefty
price tag for a standard 640x400 resolution.

>Try doing 1280x512x2 on an ST with NO extra hardware, it's not possible,
>it is on an amiga.

Again, this is only possible on an A3000. You're comparing apples and
oranges, i.e. Commo's top line product against Atari's new base level
product. This is not fair. (And again, 1280x512 is interlaced, isn't
it?)

>The Amiga's graphics are far superior to the ST for speed and it's a well
>known fact.

I talked to a Amiga games programmer about the Amiga blitter and he told
me a different story. You're right when it comes to raster tricks:
Doing this via the Copper chip is much faster than anything comparable
on an ST. Comparing the basic resolutions, however, especially the
ones that you need for every-day work (like 640x400) it shows that
the ST's video design eats up less processor cycles than the A2000's
video chips in comparable resolutions.

>One look at Gem on an IBM turned me off the ST for life.

You don't give up, eh? You're still comparing apples and oranges.
GEM on an ST is much faster than on any PC I've seen it running yet,
and the GEM desktop is much more functional. (And it really shines
if compared to the Workbench.)

>ps. How about multi-tasking on an ST ?? Impossible.

Nonsense. We've had cooperative multitasking since the ST saw the light
of day. I'm sure ATARI will give us something like a MultiFinder soon;
I bet we will see such a beastie this year.

To summarize: We don't question the Amiga's superiority in its field
(Desktop Video, games, animations and the like). When comparing the
Amiga and the ST series, please be fair: The MegaSTE is not the

A3000's counterpart!

I have had some success with gdb under the uni-sb gcc compiler and linker, but I have used

```
gcc -c -g test.c
gcc_ld -o test.tos test.o
sym_ld -r -o test.sym $GNULIB/crt0.o test.o -lgnu
```

(or something like that). I took a look at the gdb source, and it actually seems to support -g and not -gg (ie. dbx, not the native gdb format).

> I get different read/write failures each time. Has anyone else had these

Just a reminder that not all 720K drives used on Atari's will work with
Spectre GCR (or Translator one). The effect of MAC encoding is to cause the
Atari to write on the floppy as if it were a 1.44 meg drive.

Some 720K drives don't work this way because they have a filter to improve
the signal and won't pass 1.44 meg frequencies. Others don't have the
full bandwidth in their signal path (heads/electronics).

What to do?

1. replace your built-in drive with one known to work with Spectre.
2. Buy a SF314 that you can TEST first with Spectre.
3. Buy a cheap MAC. The original Magic-SAC had a program to copy discs
from a MAC to the Atari.

From: wieners@quando.quantum.de
Message-ID: <1894@quando.quantum.de>
Source record: 234973

In article <1991Feb3.213147.24259@sbcs.sunysb.edu> mrose@libserv1.ic.sunysb.edu (Michael Rose) writes:
> The most I have been able to overscan on my sm124 monochrome
>monitor has been 672x480.

That's ok for an normal SM124. Mine (build in 1985) does the same. Some of the newer SM124 (with the Atari logo painted on the front) should be able to show up to 704x480, but they're rare.

>In the overscan docs, it mentions that it is possible to overscan approx.
>800x600 (I think) on a well adjusted monochrome monitor or a multisync.

Did you have the old overscan (hyperscreen) with that manual switch or the new "Autoswitch-Overscan" (AS-OS) which automatically change the solution? There is a nice solution-table in the well written AS-OS dox. 800x600 isn't mentioned there. The maximum for monochrome monitors should be 752x480 on NEC Multisync GS or a good TVM MG11. Maybe some 816x280 on color monitors (mid solution) but I don't think many use that.

>Does anyone know what adjustments have to be made to the monitor to do this?

You can move the picture or make it a little bit brighter but if you have left the SM124 in original state, you couldn't get more solutions by internal adjustments. I've tried it. 8-) And beware, that things inside could kill you.

> I was also wondering if anyone has seen or knows anything about
>the Reflex graphics board for the Mega's.

Never heard of that here in Germany. There's a card for Megas called "Megascreen" which make a little bit more in monochrome than AS-OS. But you need a Mega (don't have one) and a mulitsync (also missed) to use it. AS-OS works with every ST (except STE and TT), every monitor and have the better software, i think.

>will it run under GEM? Is Treeview available from somewhere else? Is it
>shareware too? It was real neat to be able to find the directory you've been
>looking for, quickly and easily.

No, Treeview works on every ST and don't need Gemini. *But* if it found Gemini
1.2 (which have a nice build in ACC-protocol, samples are included in the
original Gemini-distribution), it can do some more nice things like open
Gemini-windows by double-clicking an folder and something like that.
I know people who only use Treeview (inside Gemini) to walk across their
folder and do all the file handling.

Treeview is freeware. The author likes to have a picture-card from every
user who use it frequently and enjoy it. You will find Treeview or the
original Gemini 1.2 packet. I think, the english documentation will be
ready soon and the packet will send in the binary group or avaible on an
archive site. You can also contact the author of Treeview (not Gemini!),
if you send him some bucks, maybe he will send you a disk:

1169. Name Brand Floppies

Newsgroup: comp.sys.atari.st
Date: 1991-02-05 14:57:54 UTC
From: jimomura@lsuc.on.ca
Message-ID: <1991Feb5.145754.15033@lsuc.on.ca>
Source record: 234976

Many people buy "white box" discs to save money. I've tended
to buy "name brand" floppies since I started to get 3 1/2" floppies
because 3 1/2" floppies were inherently expensive, and I wanted
to make use of the warranties. Up until now I've collected bad
disks and haven't returned many. The dealer I bought Fujis from
exchanged them directly, so I haven't dealt with Fuji directly yet.
But I had a bad BASF disk last year (bad right out of the box)
and I returned it by mail to the US. I sent it on Oct 31, 1990
and just yesterday (Feb. 4, 1991) I received my reply.

Though they were late, I'm happy to say they replaced the
disk and sent extras to recompense the delay and cost of mailing.
Overall I give BASF full marks for their efforts to honour their
warranty. If you see BASF's at an attractive price, it seems to
be a disk worth buying on that account.

1171. Neodesk3/TOS 1.4 - bug??

Newsgroup: comp.sys.atari.st
Date: 1991-02-05 15:32:24 UTC
From: lhf@ukc.ac.uk
Message-ID: <3441@gos.ukc.ac.uk>
Source record: 234978

I have recently upgraded to TOS 1.4 and I am also a Neodesk 3
user. I seem to have come across a problem with this combination.

When in Lattice Cv5, I have to set up various environment variables
to show where the binaries/libs/headers etc are. This information is then
saved into a tool .inf file, which is then used once entering the compiler
the next time. However, whenever I enter Lattice, the said .inf file is
never re-read, hence the environment variables are empty.

If I execute Lattice from the normal Atari desktop, this problem
does not occur. The problem did not occur also with Neodesk with my old
TOS 1.2. Installing Lattice within Neodesk, to make sure the program has
its current working directory in the same place as the .inf file (namely,
the text or program path), does no solve the problem.

I can of course set up the environment variables within Neodesk.
Whilst this does work fine for Lattice, it causes problems for other programs
I use. For example, DevPac2 will look at the bin variable to find MonST rather
than look at its cwd, hence being set up for the Neodesk bin, means it can't
find it. I have a copy of MonST in the lattice bin, just as a temporary
solution.

Further to this, I recently found that DevPac2 also has a problem
with its cwd, in that it too can never find a saved data file, meaning
defaults are always used.

So, taking into account it is not only Lattice which loses its
data files, but also DevPac, and this problem is not encountered from the
normal desk, could this possibly be a bug with Neodesk3 in TOS 1.4. Or, as
I hope, is it a simple matter of using some 'feature' within Neodesk, that
I am not aware of.

Thanks in advance for any help offered,

Lee.

After setting the TERM to vt52 you will still get a message that states that it can't open some temp file. If you press <return> you get your file anyway. This only happens to me if I run ELVIS from GEM. In GULAM (alias vi=elvis) the program starts right up.
By the way how do you turn on line numbers in ELVIS. The VI command [:set num] does not work.

1176. IDeas for a Sick ST?

Newsgroup: comp.sys.atari.st
Date: 1991-02-05 19:35:49 UTC
From: melton@mcnc.org
Message-ID: <2797@speedy.mcnc.org>
Source record: 234983

My ST after three years of constant (literally) service has finally let me down. When I turn it on the power light is dimmer than usual, the monitor goes to a sickly hue, and it sits there. The internal disk read indicator light is on as well, and also dimmer than usual. I at first suspected the disk drive of being burned, but have eliminated that option by substitution inside a working ST.

I now suspect the power supply. I am an electrical engineer, but have very little desire to fix a power supply since it is analog in nature.
But, I also am not going to mail it too Atari or some other fix-it house and pay them several hundred $$$$ to fix it (the going rate). I will screw it up myself before I do that.

Has anyone had this experience before, or have an ideas?

Matt Melton

Source record: 234986

Seems to me that the length of time that you have to wait until you can drag an icon depends on how you have the mouse click response time set in the control panel. It certainly doesn't take that long on MY system to be able to drag an icon, I have the click response time set to 1, 0 being the fastest. If its taking too long, try changing this setting, if you can click the mouse buttons that fast comfortably. As for the business of people with unsteady hands not being able to double click with an Atari ST mouse. Well, I just don't buy this about having to click on the same pixel that has been suggested. I intentionally moved the mouse between clicks (many times) and it worked fine. If someone can use a Mac mouse fine and not the Atari mouse then I would wonder if its because of the different style of clicking. Unless I'm wrong, I think that a Mac mouse looks for the time lapse between the upbeat of the first click and the downbeat of the second click to sense a double click. In other words, you could press the button, hold it a while, release it and click again. That would work. But on the Atari ST, it measures between the two downbeats and that would not work. I just can't believe that anyone who could double-click on a Mac mouse couldn't also do it on an ST mouse with the click response time set slow enough for them. Now, they might not LIKE it cause it doesn't work quite the same as the Mac, but I can't believe that they couldn't do it. Maybe so, but I just can't see it...

The following opinions are my own and not those of anyone else who might be registered on fquest.fidonet.org. All flames can be sent to alt.flames since we don't read that here.

This is an inevitable question, so I will ask it. How about having TOS 2.05 available for the older ST's, in both six and two chip sets (I have an early 520 now plus, with the six chip set). It sure would be a major improvement over TOS 1.0 and would be worth the investment.
Atari?, I know you are busy with all these excellent new products, perhaps your manufacturing facilities are too busy now, but this would be an excellent thing to do, make a lot of us older customers happy.

Recently, several complaints have been voiced by those trying to start using TeX or LaTeX on their STs. I did this a while back using the package of 5 disks from the Current Notes Users group (can't remember the name of the person who put together the package). The readme's were very good and the setup was relatively painless. Current Notes disks are $4 each, and it was money well spent!

>30 M are not enought.
>- What must I look out for?

Be sure to buy a RLL certified drive. Choose a 3.5" drive (5.25"
drives - as a rule of thumb - cause more noise as well as heat,
and they eat up more power). The drive must have a ST506 interface
recognizable by the two connectors needed for it (34 pins and 20 pins).

>- I it possible simply to add another drive to the ACSI-Controller ?

Relatively simple. You'll have to make two modifications on the
MF30 motherboard. The most severe problem is the power supply.

>- What driver are ok ?

AHDI won't see the second drive. The Supra driver will, as I have
been told, as well as my own driver, CBHD.

1192. Re: Tex/LaTeX & *.sty files..

Newsgroup: comp.sys.atari.st
Date: 1991-02-06 01:53:45 UTC
From: rosenkra@convex.com
Message-ID: <1991Feb06.015345.751@convex.com>
Source record: 234999

oh, BTW: if i sounded too testy over software which is essentially free, i apologise. nobody, including ME :-), should ever really complain about something they don't have to pay for. consider my rantings as more of a critique, a suggestion for improvement (which i really think TeX docs needs), etc. the last thing i wanted to do was imply that the people who made it possible have done a bad job. they did an excellent job in bringing such a complex system to "our" world. i just wish they would have written a few words for those of us who know nothing (or remember nothing, in my case). but then i am often as guilty as the next in this regard. maybe we need a "standard practices" manifesto for posting codes of this ilk. i would not even mind writing it, so long as we don't get into a religious battle over details. how about this for a start:

files in manifest (all upper case :-):

README describe what the program does, what the pieces
do, etc (so user/installer sees the "big picture")
INSTALL *precise* installation instructions, and the assumed
execution environment (cli, desktop, etc). don;t
make the user guess. and include any non-standard
environmental issues (like the termcap file cannont
have CR/LF line termination, just LF, which GNU
emacs port required at one time, and which i do
not ever recall seeing explained, for example)
BUGS we NEVER make misteaks (air the dirty laundry,
explain limitations, etc)
CHANGES change history or at least what's new in this post
XXX.MAN nroff source for a manpage (for nroff)
XXX.<section> ascii-formatted manpage (for humans, section 1 for
commands, 2 for sys calls, 3 for libs, etc, a la
BSD, if possible)

and post the readme or at least an except before the uuencoded archive so recipients know whether they need or want this post. this goes for things archived but not posted as well.

most software posted has much of this info, this just tends to make it consistent. and yes, manpages are a unix-ism, but also a fairly common method in this group for documenting things. note that i just posted the latest nroff as well as a man(1) and a pager for man (manpager). and yes, i would hope this would be in english :-). if we go thru the trouble of getting something to run, and share it, we might as well spend an extra hour to make it easier for people to install and use. [sure, why not]

back to TeX...
and i DO have both of the books mentioned, though they generally say
nothing about installing (obviously) as i recall. and i would not expect
them to say anything about installing, except perhaps as an example. i
will look at them to see if they do. one of these days, when i can find
a spare 5-10MB, i, too, will install TeX. not right now, however.

there, i feel better now... :-)

>name of such a package, and where I might find it?

i have written such a package. if there is interest, i will post it.
it handles common tasks (vector-vector, matrix-vector, matrix-matrix,
etc) including dynamic allocation/deallocation. i called it "libmatrx.a"
on my system. i am not sure i handle complex types, though. it should
not be that hard to alter. struct complex {double r, i;} and all. i do
remember writing a lib for complex math, too, and can dig it up (cmpmult,
cmpadd, etc).

it may have its roots from "Numerical Recipes in C" and an article in
Byte (i did this some time ago). i also have things like FFTs, some
LINPACK (e.g. SMAX, ISMAX, etc in C), etc. in fact, i would suggest
getting num. recipes, which is not bad for scalar boxes (but sucks
for vector machines like convex and cray which generally have MUCH
faster versions in their libraries - VECLIB and SCILIB, respectively).
u can get a PC floppy of all the codes in recipes, if u don't feel like
typing...

You didn't mention if you upgraded your ST via a memory upgrade. I don't
know about other peoples problems, but when I put 4 megs in my ST, the
power supply HUMMED, probable indication of overload and after 3 months
of heavy USE promptly died. I am almost positive that the extra RAM
shortened the life of my power supply. I called BEST and they sell beefier
power supplies for your 1040ST for just this purpose(or use to anyway).

If anybody gets a memory upgrade I would consider an investment in such
a new power supply. You machine will run more reliably longer and a lot
cooler probably too.

From: swanee@megadata.mega.oz.au
Message-ID: <1991Feb6.034332.18500@megadata.mega.oz.au>
Source record: 234853

Having just upgraded to TOS 1.4, I am having trouble with a few programs losing control of the mouse. The mouse simply freezes up when they are run. Is this a problem with the O/S upgrade? Is it possible to rectify it, or do I need to break out the disassembler and start patching? My AUTO folder contains only the SUPRACLKRD program which sets the system clock on startup. The only accessory loaded is the control panel CONTROL.ACC.

Any Clues???
Thanks in advance,
Geoff "Risky" Swan.

1197. Midi on the ST...

Newsgroup: comp.sys.atari.st
Date: 1991-02-06 04:04:01 UTC
From: Duncan.Lewis@samba.acs.unc.edu
Message-ID: <2493@beguine.UUCP>
Source record: 234854

I have a small request to ask of any and all ST-midi enthusiasts. A good
no-net-access friend of mine is looking to go into the midi arenaand
knows that atari is quite aplayer in this niche market. What he is asking
is why shouldn't he go out and buy the Yamaha portble Midi computer.
so if you could reply with answers to these few questions, My friend and
I will be very thankful. I can also post a summary.

1) Significance on the absence of a midi-thru port on the ST, anybody?
2) What cpu model is probably the best most economical but flexible one
to choose, in terms of pricing, versatility, program compatibiltiy etc.

3) Your opinion of general software for Midi use, brands, names anything will
help.
4) Why use an ST instead of the Mac or Yamaha/Casio etc.
5) Other interesting hardware implementations, like SMPTE equipment etc.
6) What your setup is and how productive has it made you.
7) ANything of value you'r like to add including flames etc

Again, I'd like to thank anone who responds for their time.

>[wants to put his sozobon library files on ramdisk]

I think what you have to do is in your sozo.g file, put in a line like this

setenv LIB H:\

if the files are in the root directory on drive H: or list the directory the files are in.

By the way, this stuff is written up in the documentation. I recommend you do what I did: print the manual, maybe with a DTP program like TimeWorks, and staple it together. It impresses people what you show them the manual, and then say, "It's public domain."

Have fun.

>What's the story with 640x400x2 ?

Duh. That means that in this mode the machine can display 640 dots
horizontally and 400 vertically with a choice of 2 different colors :^) :^)

>An amiga can do 640x400x16 AND even
>640x400x4096, without any additional hardware.

Funny, I don't seem to remember the poster saying the amiga couldn't do
that or that the STe could? It's not relevant, and could potentially
start a flame-war... Heck it's not even news, the amiga has been able to
display that resolution since 1986-7 and the ST series has been doing
640x400 in monochrome for ages. IMHO, Both machines' stock graphics need
updating to be considered "state of the art"

What you need is two more environment variables.

LIB=H:\sozobon\lib
INCLUDE=H:\sozobon\include

or whatever your paths may be.

The -I flag tells cc where to find the *.h files.

It looks like you are using a single drive system. Before I got a hard
disk I was in the same situation. What I did was to keep the binaries
libs, etc on A: and copy the source to my RAM Disk. It worked quite
well and certainly should reduce the amount of copying needed.

John

>known fact.
>One look at Gem on an IBM turned me off the ST for life.
>ps. How about multi-tasking on an ST ?? Impossible.

Ok, here we go:
Amiga's graphics are far superior to the ST.
Amiga's sound are far superior to the ST.
Amiga's add-ons are far superior to the ST.
Amiga's OS is far superior to the ST.
Amiga's GUI is far superior to the ST.
Amiga's software is far superior to the ST.
etc. etc.
Deep in his heart, every ST owner feels pity not having bought an Amiga.

You're lucky now?
Ok, then turn away from this Newsgroup, stare at your -far superior- Amiga
screen, get an headache and shutdown.

1206. Harddrive problems

Newsgroup: comp.sys.atari.st
Date: 1991-02-06 13:31:47 UTC
From: oddjob@oz.plymouth.edu
Message-ID: <1991Feb6.133147.16679@oz.plymouth.edu>
Source record: 234861

[this a a reposted repost - we just went Internet and have been having News problems]

My hard disk had a nasty shock last week during a rather heavy bout with static electricity. It recovered after I turned it off and back on but now it seems to be flaky. While running minix it made some funny noises and seemed to slow down. I had to reboot (but I haven't tried to shut it off and back on yet.....).

(I wrote the above a couple days ago... but we were having News problems so it didn't appear to get posted to the outside world. My sincerest apologees to anyone who might have seen it before.... My hard drive has since continued to behave in such an erratic manner as described above except I don't have to reboot , just have to wait for it to start behaving itself again. But it isn't consistent. (My current theory is that how it behaves depends on the quality of power getting to the hard drive ..... could nbe wrong but it sounds good :-))

I had planned to do some serious hacking with Minix this semester (to teach myself enough to write an application in C that I want to be portable between Minix, Un*x, MiNT and TOS/GEM (TOS/GEM being last since I've got what is quickly becoming an antique [even for an ST], a 1040STf with TOS 1.0 (6 chip ROMs, empty board space for a blitter, etc) and by the time I get this program done I'll be able to afford a TT ...)). But I haven't gone near Minix since the first drive problems since it had problems with that since Minix almost continually accesses the harddrive and if it's not there..... **BOOM**
(* Can you tell I've got a degree in English lit. from the rather convoluted paragraph above... %-> ??*)

Does anybody know of a utility program that could check the controller on my harddrive to see if it is ok ??? It's a 30 meg Supra harddrive, approximately 3 years old (one of the ones with the bad clock chip and a SCSI port (How do I test something like that ?? ARGH!!!!!!). I really can't afford to have it die, but if it does I'd like to know why and what I should replace (if I can....)

-Andy-

Try the HP48SX calculator. Actually I've seen a shareware program for matrix manipulation for the ST, but whether it handles complex numbers I don't know (although any decent program should). It is called MATRICKS.TOS and comes with a 22 Kbyte manual. The version in my archives is dated May 1989, and if you can't find a more recent version I can send it out. However, I suggest that you contact the author, Victor Eijkhout, at u641000@hnykun11.bitnet or eykhout@wn2.sci.kun.nl for current status.

>Now I see it advertised by Public Domain libraries.

Up until 0.9 NEOchrome was a freebie with the ST. Ver. 1.0 was
commercial, and Atari stopped bundling it. That was a long time ago,
and I don't know the current status.

Technically I suppose that giving a bundled copy of ST software to
someone who bought a later ST without it (including NEOchrome, 1st Word,
etc.) is illegal, although a lot of that goes on. But a free copy of
NEOchrome 1.0 or later is definitely pirated.

TA> Top 1.2 was released with a bug which made it produce a bad 'jas'. A fix
TA> was posted later. If you need the latest fixed release, see above.
TA> Unfortunately, most bulletin boards and archive sites have NOT put in the
TA> fixes.

I have put a fixed version in our archive. It has all fixes that I have
seen on the net + I fixed the assembler for the stop instruction (I don't
think that many people use this). The compiler is now able to compile
itself with -O.

I also made a small change to make to have it override macro values by
command line arguments of the form MACRO=value.

The package contains binaries, sources of the compiler and tools, h files
and binaries of dlibs, and gemfast. The sources of dlibs and gemfast
libraries are not includes, as they are somewhere else in the archive. Also
the libraries don't have the latest patches, but once you have the compiler
that isn't hard to do.

How to get sozobon.zoo from the archive at
Dept. of Computer Science, Utrecht University:

NOTE: In the following I have assumed your mail address is john@highbrow.edu.

Of course you must substitute your own address for this. This should be
a valid internet or uucp address. For bitnet users name@host.BITNET
usually works.

by FTP: (please restrict access to weekends or evening/night (i.e. between
about 20.00 and 0900 UTC).

ftp archive.cs.ruu.nl [131.211.80.5]
user name: anonymous or ftp
password: your own email address (e.g. john@highbrow.edu)
cd /pub

don't forget to set binary mode if the file is a tar/arc/zoo archive,
compressed or in any other way contains binary data.
get ATARI-ST/lang/sozobon.zoo

by mail-server:

send the following message to
mail-server@cs.ruu.nl (or uunet!mcsun!hp4nl!ruuinf!mail-server):

begin
path john@highbrow.edu (PLEASE SUBSTITUTE *YOUR* ADDRESS)
send ATARI-ST/lang/sozobon.zoo
end

NOTE: *** PLEASE USE VALID INTERNET ADDRESSES IF POSSIBLE. DO NOT USE
ADDRESSES WITH ! and @ MIXED !!!! BITNETTERS USE USER@HOST.BITNET ***

The path command can be deleted if we receive a valid from address in your
message. If this is the first time you use our mail server, we suggest you
first issue the request:
send HELP

Hello World,
Can anyone send me some startup code for Sozobon C that does not do anything *illegal* with its basepage... like the original version does. One that would work OK with RTX and/or MiNT (0.7) and debuggers (Specifically MonST2.0).

Thanks,
Andrew

UUCP: {crash tcnet}!orbit!pnet51!schaper
INET: schaper@pnet51.orb.mn.org

Writes:

This is an inevitable question, so I will ask it. How about having TOS 2.05
available for the older ST's, in both six and two chip sets (I have an early
520 now plus, with the six chip set). It sure would be a major improvement
over TOS 1.0 and would be worth the investment.
Atari?, I know you are busy with all these excellent new products, perhaps
your manufacturing facilities are too busy now, but this would be an excellent
thing to do, make a lot of us older customers happy.

First of all the new TOS is too large to fit into the 192K ROM address
space with the old ROM chip sets.

Secondly, lots of the extra baggage in the new tos would be quite
useless, if not impossible to implement on the old ST's/MEGA machines.

If I was you, I would push for the new desktop. Its grand. I never thought
I would actualy like my desktop...but I do now! (Kisses and Hugs):)

Newer versions of Templemon use <Ctrl><Help> as exec key. The scan code for the break code can be changed in a kind of extended prog header.

Source record: 234868

Could I hear from some of you who have successfully brought up PC-Ditto II on your hard disk? I have a Syquest drive, Tos 1.4, and a Mega-2. I just got PC-Ditto II going, and formatted the C partition (about 5 meg) and can read/write files from MS-Dos. I put a boot on the hard disk, and everything looks fine, but when I start PCD-II, it first identifies my hard disk, says put in a floppy or it will boot from the hard disk. If I don't put in a floppy, it momentarily hits the hard disk then gives me the non-system disk error. Should I mention that I'm using MS-DOS 3.1? I'm going to try a more recent version of MS-DOS to see if that helps. Oh, and by the way, when I go back to TOS, the ST doesn't seem to see the files that MS-DOS put on partition C. I thought they could both go there! Someone who has some experience here, please email me as this may be of only minor interest to the rest of the net.

(And thank you very much in advance.)

You have a little textfile in the auto-folder called OVERSCAN.INF with all the names of the programs in it, which don't like anything else than 640x400. If you start such a program, Overscan will switch the solution at first and the application is happy. No problems with any program I've tried so far. The most I use every day, support the higher solution of Overscan (as all well written GEM-application should do). But I don't have the time for much games... 8-)

1219. TOS 1.4 upgrade Problem

Newsgroup: comp.sys.atari.st
Date: 1991-02-06 16:57:51 UTC
From: oscar@jpl-devvax.JPL.NASA.GOV
Message-ID: <11327@jpl-devvax.JPL.NASA.GOV>
Source record: 234872
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I just got an OS upgrade to 1.4. I used to have 1.0.
The problem is that I can't get my machine to boot from
my harddisk. Several of the things that have occurred
and which I have tried are: (I have a homebrewed harddisk.
It has an ICD host card and I have the latest ICD distribution
disk.)
1) I have tried booting normally and get two bombs.
2) I have booted while holding the alt key down (This
is suppose to override the booting from harddisk)
3) I have booted with the harddisk disconnected then
reconnected it and could not access it.

I think if I can get to my harddisk I could eliminate all the
auto loading programs and then things would be fine.

Also if there are known accessories which do not work under 1.4,
or are programs which are no longer of assistance (ie. pinhed,
fatspeed, ...)

Thanks in advance for any assistance

1221. Re: UUDECODE Help !

Newsgroup: comp.sys.atari.st
Date: 1991-02-06 17:29:48 UTC
From: A512HJAL@HASARA11.BITNET
Message-ID: <91037.134050A512HJAL@HASARA11.BITNET>
Source record: 234874

UUDECODE comes in a package mostly called UUX and somtimes UUXBIN when
the C source is included. In these packages both UUD(decode) and UUE(encode)
are included. These packages are packed with ARC most of the time so you'll
need that to unpack UUD with which you can decode other files.

If you're allowed to use FTP you could try the various ANONYMOUS ftp sites
and scan the UTILITIES directories.
try 129.69.1.12 dir softcataricutilities.

Don't panic; I spent several weeks to assemble my "Compression Suite", one
disk full with programs (and shells for these programs) to pack and unpack
ARC,ZOO,LZH,SH,ZIP and UUE files.

When I looked into this on PC=Ditto I, it turns out that its boot program
was checking both C: and d: for a Ms/dos signature. If either failed
it would not boot. Since little there changed in PC_D II, I suspect its the
same.

The fix then is to use pcdfix on both c: and d: . This in no way changes
d: if its a TOS partition. It just makes PC_D happy.

Howard Johnson posted a very good explanation about the problems and I'm going to add some more ideas.

One thing to check is if your drive is a NEC mechanism. Those have known problems reading GCR disks and require a hardware modification to work properly. If it is a NEC drive, contact GBS for the fix info.

You also didn't mention whether you are having the problems with an internal drive (especially a Mega internal). If it is an internal drive you should try adding extra shielding around the drive and its cables and then ground the shielding to the motherboard. The ST generates lots of RF and on some machines (Mega2's particularly) it just drones the Mac signal out. Although this mod never worked for my Mega2, I know lots of cases where it has cured the problem.

Another idea is move the monitor farther away and even a different angle. When moving my system around, I placed the monitor on the floor to make some temp room. This caused my rock solid external drive to stop reading mac disks. Moving the monitor back to its old spot (which was in fact closer to the drive but had a shelf between them) cured the problem.

Also check your drive speed is 300rpm.

Hope these suggestions help!

Which version of Spectre? the GCR test come with version 2.3 (the one before 2.6) has problem with single drive setup. And some system is very sensitive to the E_M interference generated by the monitor. My old 1040 ST was one of them, try to move the monitor away from the cable and drive then try again. Also put a sheild on the drive cable help.

I was merely posting an observation, not offering technical explanations.
What I said about not moving the mouse between clicks was also an
observation. However, it IS a fact that it's much easier to double
click on a Mac than on a ST. I use one at work and the other at home.

Best regards, Dr. Peter Kittel // E-Mail to \\ Only my personal opinions...
Commodore Frankfurt, Germany \X/ {uunet|pyramid|rutgers}!cbmvax!cbmger!peterk

Writes: ...

In my opinion, STs are nice, simple machines with a good monochrome
display and a nice, but limited OS; Amiga is a more complex machine
with a powerfull, state-of-the-art OS and far better colour capabilities.
And when regarding current sales figures, Amiga is the machine of
the future, I wouldn't too much on Ataris in this aspect.

Notice the third word in the paragraph...OPINION. Obviously this man
never EVER owned an ST. I would contend, that after the equavalent ad ons
such as a color board/graphics card, in Europe which there are many,
the ST would look just as nice as an AMIGA machine.

As for sales, thats funny, a German friend on my floor says thats all there
are in Germany is Atari's with a few Amiga's sprinkled here and there???

Atari has very healthy markets abroad and just like commodore, Atari has
yet to take advantage of the USA market.

If you want to do word processing, I hardly think you would have time to
play a game at the same time. As for multi tasking, Atari multitasks
REALISTICALLY. That is, if you want to print something out, or download
something or do something else like play music that doesn't require
your constant interaction there are plenty of options available to help you
do these things in the background so you don't waste time so you can do
something else..like play games.

Really, multitasking is WAY overplayed by AMIGA people. They are not
the only people who have multi tasking machines, its just that workbench
supports this option automatically. While on the ST its an add on.

Source record: 234880

I just downloaded "ECOLOGY.LZH" from Delphi, and I can't figure
out how to play it (Guess I'm just stupid... 8^B). Can anyone
clue me in? It looks great!

BTW, I love the fact that the music soundtrack pipes out of the ST's
MIDI ports. It was one of my favorite features of Ultima III & IV
(they discontinued it in V >-( ). Nothing like fighting a fierce
battle with theme music shaking the walls.

Well each machine has its merits. The way you should choose a machine is to find the software you plan to run, look at what you might want to run in the future and buy the machine that runs it.

No one machine does all tasks well. Find a machine that will do the task you wish to do well.

So now that you have figured out what software you want to run; does it run on a Mac, Atari, PC clone, Amiga, or NeXT.

I personally own an eight bit Atari 1200XL (haven't touched it in a long time), 386sx PC clone (I happen to like it) running Win 3.0, and I'm waiting for my NeXT to be delivered.

Once again one machine is not suited for every task. Find a machine that runs the software you like and buy it.

>twmanino@eos.ncsu.edu

This is both an answer and a question. First, Michtron makes (made?) a utility called TuneUp, which works fine on normal GEM partitions of 16mb or less. It will not work on BGM partitions or ones > 16mb. Thus, if your partitions are all of less than 16mb, it would be a good one to get (I believe it was sold under the name Turbo HD kit, and includes a disk cache program also).

Now the question: Is there a defragger that works with TOS 1.4's bigger partitions? You can go up to 32 megs!

Oh, by the way. I have a buddy with TOS 1.4, who brought his hard disk (all the way from texas) and hooked it up to mine on my Mega2. Since I have TOS 1.2 (which I am going to correct!), I could not read half of his partitions. Just something to keep in mine if you have 1.4 and ever intend to hook up to something else. I am going to keep my partitions at 16mb, so I do not have to worry about some program destroying my stuff because it could not handle the new 1.4 partition limit!!

Message-ID: <91037.172827CXW148@psuvm.psu.edu>
Source record: 234684

The limit on Amiga video ram is due to the inability of the custom chips (the three chips called the Agnes, the Blitter, and the Portia). These same chips are responsible for the multitasking power of the Amiga. The 68K CPU is free to attend to other operations while Portia handles the port accessing, and the Blitter and Agnes operate the graphics and sound. Every limitation on the Amiga is due to these three chips, which Commodore has been slow to revise and upgrade. The only exception being the new 'Fat Agnes' which can access 1 meg of video memory at a time, and the new ECS (Enhanced Chip Set). While a slight improvement, the only thing I can remember about the new capabilities is the ability to run Viking Moniterm resolution in 4 colors. There is also a 50MHz accelerator board available for the Amiga, and the Tahiti rewritable optical drive which stores 1 gigabyte of information. The Amiga 3000 has the capability to have RAM expansion to a few gigabytes (but I don't remember the exact number). You should both get your facts straight, and read industry-wide publications instead of product specific publications. Every system has it's limits. Read Byte instead.

>board of any sort. Does anyone know of a company that supplys this?

How many X packages are there, anyway? Only a couple, last I heard.
Would probably work very well using serial IP at 230kbps....

> I was looking through a book on programming for X, and it seems that
>the primitives look a lot like VDI calls. An interesting project would
>be an X terminal package that mapped the X communications to a Gem window.

Well, there's a company marketing a product called XVT, which is a higher
layer library that maps graphics calls into MS Windows, Mac Windows, and X.
You might look into talking with the company and getting GEM supported.
(It sounds like a good idea, so you only have to write one version of a
program, no #ifdef's or anything, just compile it on each target system
and go...)

The 3000 setup has 2MB chip.

Framebuffers make for a fast graphics system, giving the chipset and chip
memory you increase performance, but decrease flexibility.

In this area, C= is known to be working on a few things:
1) Their new graphics board 24bit palette, 8-bit look-up table
2) retargetable graphics (to enable workbench to use any device
such as their board)
3) The 3000 can run two cpus efficiently ('30, '40). The '30 might
become a blitter. This is only speculative on my part.

Their graphics board sounds REAL good. Its currently used for openlook,
and I hope they decide workbench could use it.

bye,
Doug

>are in Germany is Atari's with a few Amiga's sprinkled here and there???

Well, your friend has an unusual floor. Commodore sells
more personal computers in Europe than any other company except
IBM, they have over 10% of the market. Commodore's sales are also
over twice that of Atari's, in dollars. Your friend is simply
incorrect. Atari is going downhill if you look at their
statements.
>
>Atari has very healthy markets abroad and just like commodore, Atari has

>
Multitasking is only REALLY useful with a powerful
computer. On a standard Amiga, you can format on one disk drive
and compress on another while word processing. But on a
higher-end Amiga with hard-drive (the most important add-on) as
well as 1MB-2MB of memory, you can run many programs
simultaneously. Interprocess Communications is a very powerful
feature that is underused.
To say multitasking is WAY overplayed is to have never
used it to its fullest. Most people don't. And multitasking is an
add-on to MS-DOS if you count their TSRs.

>price tag for a standard 640x400 resolution.

You are wrong. I have an Amiga 2000 running productivity mode, it is
possible on a 500/2000/2500 amiga as well, all it requires is the new
Denise chip which costs $30, and Workbench 2.0.
>
>>Try doing 1280x512x2 on an ST with NO extra hardware, it's not possible,

>it?)

You are wrong again. It is interlaced, but this display can be used on
about the cheapest monitor you can find. By the way, we can do
1280x256x4, WITHOUT flicker.

>>The Amiga's graphics are far superior to the ST for speed and it's a well

>ones that you need for every-day work (like 640x400) it shows that
>the ST's video design eats up less processor cycles than the A2000's
>video chips in comparable resolutions.
>

Rubbish. The only graphical operation that is faster (very very
marginally) on the ST is polygon filling as the blitter is not suited to

it. The blitter can draw thousands of lines per frame and move
pixels/data much faster than an ST. The Amiga does not take any
processor cycles to do 640*400 with a flicker fixer, only using
productivity in 4 colours takes chip bus time, but does not slow down
fast mem access. You can always switch to 2 colour prod. (same as
ST) and have no bus contention again. The Amiga video design is far
superior to the ST, due to the dual access ram which allows parallel
processing in different ram areas (gee I wonder why the Cray uses
dual ram porting....?).

I think your Amiga games programmer mustn't have even read the
hardware manual yet. (BTW, I know it backwards)

>>One look at Gem on an IBM turned me off the ST for life.
>
>You don't give up, eh? You're still comparing apples and oranges.
>GEM on an ST is much faster than on any PC I've seen it running yet,

1242. UPLOADs to atari.archive

Newsgroup: comp.sys.atari.st
Date: 1991-02-07 02:16:29 UTC
From: warwick@batserver.cs.uq.oz.au
Message-ID: <7207@uqcspe.cs.uq.oz.au>
Source record: 234889

Why is it that there are plenty (well, enough) uploads to atari.archive, and
plenty of postings to comp.sys.atari.st, BUT...

SO FEW POSTINGS ABOUT UPLOADS ???

I hate downloading something, only to find it is useful, but not to me.
Sure, it would be fine if there was an up-to-date INDEX on the archive,
but why not make information more rapidly available?

To avoid being a hippicrit, here's my main stuff:

games/strabble.arc

The Scrabble game.

MONO only, 1Meg. (120K .PRG, 360K dictionary, 20K RSC)

Very High quality GEM INTERFACE.
45000 word dictionary.
Very hard to beat COMPUTER OPPONENTS.
Novice computer opponents too.
You can search dictionary, WITH WILDCARDS.
Load / Save games.

I've written a colour version now, but I haven't had
time to upload it, mail me if interested.

games/puzzler.arc

Collection of 7 single player puzzles.

Supplied as .ACC and .PRG
(.ACC uses 100K of memory though!!)

1. Flipper (Super INVERT, al la gemini.arc)
2. Tic-Tac-Toe (Classic, only for completeness
3. NIM (Another classic, take matches)
4. Pyramid (Very hard to beat)
5. Jumper (Solitaire on a triangular board)
6. Memory (Match pairs of pictures)
7. Slider (Get the letters A to Z in order)

+ Adjustment dialog to change games slightly
+ Info dialog
+ Quit button (waving hand)

Okay, so some people HATE Scrabble, I love it. STrabble is one game
I play a lot. Be prepared to have a dictionary handy!

The Puzzles are fun to use for a while, eventually you'll take it
off the desk menu though.

Warwick.

Ok people, here you go with the DEFINITIVE answer. I own BOTH a MEGA 2 and an Amiga 500. Now, I have personally come to like each machine for each of its strong points. The Amiga has the graphics. No Question. Don't get me wrong,

the ST has the capbility, but I have better use for it. Now the ST is used for all of my MIDI tasks as well as modem uses(I am doing this off my MEGA) and Word Processing. My processor of choice is Word Up. I also DTP off the MEGA with Calamus. I also use the AMIGA for GenLocking. Now that Dpaint is out for the ST I must say that I find it easier than DPIII for the AMIGA. But this is not a HOLY WAR. DOn't start one, it isn't worth it. Just admit your personal findings about the machines and let it go, there is no reason to attack machine owners. And just for the sake of Argument, the multitaksing on the AMIGA is just too slow for me. Oh well.

Ever notice how it's always the Amiga owners who feel the need to press their Amiga-ST flame wars over to comp.sys.atari.st?? You'd think if their system was soooooooo much better, they wouldn't be so insecure about it. I notice most Atari voices on this group seem rather confident and content with THE POWER OF THEIR MACHINE (not necessarily with Atari itself...*SIGH*).

Of course, I just hope everyone realizes, that neither an Atari OR a Commode-ore can come close to matching a DEC VAXstation...ahhh...bliss!

=)

I want to use an Atari 520 as a video character (and graphics) generator.
I'm envisioning a (small?) word-processing system that would support
multiple fonts and point sizes, centering, and justification, combined
with animation capabilities (primarily to implement scroll, crawl, blink,
and other special effects). Has anybody tried this sort of thing before?

Any sources of/references to

- bitmap or shape font libraries
- fast scan conversion algorithms
- spline algorithms
- animation languages
- people interested in collaborating

would be very much appreciated.

OK, guys. Isn't it about time we nipped this ST vs. Amiga flame war in the bud. I personally don't mind if you throw verbal megatonnage at each other, but by posting it to a group other than comp.sys.jihad where this stuff belongs, you have started to waste my time.

And now I intend to pour what I hope is the first bucket of cold water on the discussion. When I purchased my machine (and I'm not telling which one I have), I based my decision upon the amount of money I had to spend, what software I could run, what machines were available to me on the day I purchased, what I thought I could eventually do with it, etc. In short, I bought the machine that I thought would give me the most bang for my dollar. Like any normal computer nerd, I would have liked to have been able to have bought a better machine, but then everyone wants a CRAY-PC. The simple fact is that I knew what were the available options for me and I made my decision. I am not dumb or stupid. I don't have a history of insanity. I made a sound decision and I have not regretted it at all. Not even once. My machine has done everything that I have needed or expected. And quite frankly, I resent someone who knows absolutely nothing about my choice or the constraints that I was working within telling me that I made an incredibly stupid choice. I did not.

Now, I read certain news groups to keep up with developments related to the computer that I bought. In this way, I hope to learn about new upgrade options, new software, what works, what doesn't, etc. In short, I seek to continue to be able to make thoughtful, informed choices. These flame wars usually result in nothing more than heat and noise. Illumination is one of the last things that is ever found in one. If I really want to learn more about some other machine, then I will do the most logical thing. I will start reading the news group for that machine. I don't have the money or the inclination to change computers at this time. And when I do, I will read the appropriate news group. So please take your little war somewhere else, and let me get on with learning about what I have.

Terry W. Reeves

> 1, 0 being the fastest. If its taking too long, try changing this
> setting, if you can click the mouse buttons that fast comfortably. As

I just realized that I was some absorbed with the issue of having to
double click on one pixel that I didn't realize that I was totally wrong
here in reference to clicking and dragging. There is a delay before the
icon is highlighted and you can drag it (although you can actually start
to drag before its highlighted) that probably has nothing to do with the
click response setting. It doesn't bother me that much, and I don't
think it takes even a full second, but it is there. I would tend to
agree that the way the Mac interface handles both click-and-drag, and
double clicking is a better, easier for most folks. But, I don't think
the ST way is so bad that it deserves extreme criticism. Oh well, just
thought I would admit my mistake before someone called me on it (if they
haven't already)....

The following opinions are my own and not those of anyone else who
might be registered on fquest.fidonet.org. All flames can be sent to
alt.flames since we don't read that here.

>for it on your local BBS. If you already have foldrxxx.prg (or whatever
>it's called) installed, raise the number.

Having experienced similar problems as described above using TeX ;-(
i came to the conclusion that it was memory management, not the 40-folder
limit (foldr200.prg didn't help; shuffling memory did sometimes. also
the available memory sometimes came down to a whopping 10k -- not enough
for TeX (I am stymied)).

My solution to this "feature": use tos 1.4. I am now running without
foldrxxx.prg && cache020.prg and have not experienced the problem.

Well you're a latecomer to the discussion on new TOS versions but your vote on
the matter is most welcome. I should point out that I doubt if the new TOS
will fit in 192K so the general concensus of opinion is to release it in part
or whole as a RAM loadable version. This would not be a great benefit to
floppy only users but would greatly enhance HD systems.

Agreed. I mailed the original poster with some advice, quoting the good and bad points of both machines. In the end I didn't recommend he get one machine, but I game him points to think about for both machines. It's his money and just because you like your machine for your uses doesn't mean it's suitable for him. Saying "a is better than b" doesn't really help. No machine is better than another machine on all points. Owning one machine and never looking at the competition is a taking a very blinkered view on the industry. You end up being a die-hard owner of one machine, never even considering buying "the rival" systems.

Please mail the original poster and not post to this newsgroup. Most of us have had years of "a is better than b" and are sick of it. It never gets us anywhere and it in fact projects a childish attitude from both camps. It also wastes bandwidth. Do not do this, it is wrong.

David.

hohr@cernvax.cern.ch (roger hoh) writes:

> The AES evnt_button() returns me zero, and is not waiting: why??
> I just want to wait until the RIGHT mouse button is pressed.

Make sure that you use the correct parameter for evnt_button. The parameter
is a bit vector indicating for which mouse button status to wait, e.g. the
bit vector 00 waits for both buttons being up, 01 waits for the left button
being down and the right one up, 10 (=dec.2) waits for the right button being
down and the left one up, and 11 (=dec. 3) waits for both buttons being down.
I suppose this is your problem..
I had another problem about this, btw: it is not possible to wait for either
the left or the right button being down (neither with evnt_button nor with
evnt_multi). But waiting just for the right button to be pushed should be
possible.

so long

Hi all there,
maybe s.o. of you can help me:
my ST doesn't accept any mouseclicks anymore and the menues do not
roll down if i want to select them. If i try this with ALT+(up down ..)
i works without any problem. In addition the keyboard-klick sounds all
the time if i switch my systen on. After i press the reset button the
ST sometimes takes it's work (exect the mouse problem), sometimes
it does not make any actions after the reset.
Hab anybody the same problem already ? I soppose this could be a
damage due to a 'little' electrostatic shock, 'cause when i switched
the CPU-HALT switch (which i built in on the 68000 HALT & GND pin)
there was a litte 'zip' and i felt a little electic shock.
Please, if anybody can help me, send me you messages!

Thanx a lot SAS

How about multi-tasking on an ST ?? Go for it.
Alright, I know that TOS and GEM aren't inherently multitasking, but there are several multi-tasking OS available for the ST (including Minix). MiNT will run TOS programs on a multi-tasking basis. Any inadequacy in the ST design (whether in hardware or software) can be remedied.

1267. opinion about posted 'game'

Newsgroup: comp.sys.atari.st
Date: 1991-02-07 12:36:12 UTC
From: davidli@simvax.labmed.umn.edu
Message-ID: <1991Feb7.123612.1@simvax.labmed.umn.edu>
Source record: 234814

I would just like to take a moment to comment on an upload that someone recently posted as being on atari.archive.umich.edu. The file name is SADDAM.LZH, and it is purported to be a 'game' where one shoots an undefinable man riding on a camel.

I, personally, find such a concept disgusting. It promotes a bigotted racial stereotype of Arabs. It's on the same level as video games such as the infamous 'Custer's Last Stand', where the objective was to rape as many Indian women as possible.

If someone wants to write a war game based on the current strength levels in the Iraq/Saudi area, I wouldn't object. War games have a long history, and the 'units' involved are more or less accurately portrayed. Using games for the personal villification of Arabs (or any nationality), on the other hand, is just stupid.

A lot of matrix software can be obtained from netlib. This archive contains
the BLAS (Basic Linear Algebra Subprograms) of Level 1-3 (Vector, Matrix-
Vector,Matrix-Matrix operations), the LINPACK package for the solution of
linear systems, the EISPACK package for eigenvalue problems and a lot of
other stuff. The above mentioned packages are written in FORTRAN (as most of
the software from netlib); the available precision is REAL, DOUBLE, COMPLEX
and DOUBLE COMPLEX.
You will also find some C codes dealing with matrix problems

To get a description send a mail to : netlib@ornl.gov
with the body : send index

1274. About to buy TOS 1.4

Newsgroup: comp.sys.atari.st
Date: 1991-02-07 15:09:44 UTC
From: L.B.Brown@newcastle.ac.uk
Message-ID: <1991Feb7.150944.11144@newcastle.ac.uk>
Source record: 234820

I'm considering buying TOS 1.4 for my 1040STFM and have heard a lot
about the improved file selector and Desktop. I have not heard anything
about improvements to the BIOS, XBIOS and GEMDOS, such as:-

o Bug fixes
o New features
o Speed improvements
o Anything else

Does anyone know (I'm sure Atari does) the details of such improvements?
Any replies would be greatly appreciated.

Leigh.

>is why shouldn't he go out and buy the Yamaha portble Midi computer.
> >so if you could reply with answers to these few questions, My friend and
>I will be very thankful. I can also post a summary.

I'll post this to the group. It beats all the inane Amiga/ST flames
(my contribution: mine is better mine is better mine is better).

>1) Significance on the absence of a midi-thru port on the ST, anybody?

I have really never missed it, as my sequencer has a MIDI merge function
built in. I guess Atari didn't want to have to deal with three MIDI
ports, so they combined the MIDI out and MIDI thru into one port. This
makes the Atari's MIDI out non-standard, but it shouldn't cause a problem
unless you use MIDI cables that are also non-standard.

If you feel you absolutely need a MIDI thru on the ST, STart magazine
had an article showing how to make a box that splits the output into
separate out and thru ports... I don't think there was any fancy
circuitry, just a glorified Y-cord (only works because Atari used the
two pins not used by the MIDI spec).

>2) What cpu model is probably the best most economical but flexible one
>to choose, in terms of pricing, versatility, program compatibiltiy etc.
>

Well, MIDI software tends to be a RAM hog, and if you are really going to
get into it, you'll need to start with at least 1 Meg. I have a Mega 2,
and I will be upgrading to 4 Megs to support my music software alone.
The cheapest way to go is probably an STE, and you can upgrade the RAM
with Simms. I like the separate keyboard on the Mega, though, and it
may have one more advantage. Dave Small's boys have come up with a
card for the expansion port on the Mega that will let you run all
Mac MIDI software (in conjunction with GCR???).

>3) Your opinion of general software for Midi use, brands, names anything will
>help.

Well, I have only used Dr.T's, so I can only speak for it. Their
"entry level" sequencer, Tiger Cub, is very nice, and has many features
of professional packages. I believe it lists for $150. The professional
package is called KCS Omega (KCS=Keyboard Controlled Sequencer), and
lists for $450. Dr.T has a whole line of software: sequencers,

librarian/editors, SMPTE boxes, scoring programs, instruction, algorithmic composition, a MIDI specific programming language and more. And most of it (perhaps all of it) can work in Dr.T's multitasking scheme (MPE=Multi Program Environment).

My overall impression of Dr.T's is that it is perhaps not the most intuitive interface, but it is extremely powerful and flexible. And their support is terrific.

>4) Why use an ST instead of the Mac or Yamaha/Casio etc.

Depends on your application. If you want to take your computer on the road, I'd definitely get a portable model, so the Yamaha or STacy are the way to go. For a home studio, you'll want a better screen, so stick with the Mac or ST. And get a monochrome monitor for music.

The Yamaha has all those nice extra MIDI ports on it, but my DMC MX-8 switcher/merger more than makes up for it. I really have no Idea how well the Yamaha is supported in terms of commercial software, though. I also don't know what kind of CPU it has, but forget it if it doesn't have at least a 286 (preferably a 386).

If you want a Mac, get one with a big screen, and of course, you'll have to get an external MIDI interface. Probably the most expensive option.

MIDI support for the ST is tremendous. I spoke with Dr.T's tech folks last week, and they plan to continue supporting the ST (also the Mac and IBM). Emile Tobenfield (Dr. T) was my neighbor a few years back, and although he started developing on the Commodore 64, the ST was his system of choice, and all other versions of his software were ports. Bob Melvin (The Caged Artist) is currently working on a Mac port of X-or, but plans to return to Atari development by April.

Whatever you choose, get a hard drive. Life is too short.

>5) Other interesting hardware implementations, like SMPTE equipment etc.

All kinds of stuff availible. DMC wrote an ST specific editor for their MX-8 MIDI switcher, though I use Dr.T's X-or (with a profile that I modified slightly).

>6) What your setup is and how productive has it made you.

I have a Mega ST2, 30Meg hard drive, a DMC MX-8 switcher/merger, three synths/sound modules, and a Casio MIDI guitar controller. My software setup is KCS Omega, X-or universal librarian/patch editor, and T-Basic programming language, all from Dr.T. When I've got it all cranked up, I am God.

Like any new technology, you'll spend a few weeks playing with it before you feel comfortable, but you should start to be productive right away. I started with KCS V1.6 two years ago, and I'm still finding neat new tricks. Be prepared to

spend some time experimenting, and READ THE MANUAL!!!

>7) ANything of value you'r like to add including flames etc

I took a computer generated music course at Colgate University
in 1982, and the lab setup there was valued in the hundreds of
thousands of dollars. My setup at home can now run rings
around it, and I spent less than 5K for everything.

If you would like, I've written a rather lengthy review of KCS,
and I'll email you a copy, or post it if I have some requests.

The only reservation I'd have on the ST, is that if you don't have
a local music or computer dealer that can demonstrate the software
to you before you buy, go with another brand. There's just no
way to judge and compare music software on paper. You can get
demo disks of several brands, but you really need to see them
run by folks who know what they are doing (those demo disks
usually have terrible documentation).

Flames? You bet! Mine is better mine is better mine is better...

>the ST would look just as nice as an AMIGA machine.
First of all, the add ons you are talking about are hard to impossible to get in the US.
Second of all, the add ons that you are talking about are either specialty items for people who want to work in graphics (and thus have very limited support) or are not as great as you are making them out to be.

I have an Atari ST with a JRI 4096 color board. Big deal, I have 4096 color pallette. I can't display all of them at once like I can on my Amiga 3000.

>As for sales, thats funny, a German friend on my floor says thats all there
>are in Germany is Atari's with a few Amiga's sprinkled here and there???
>
Amiga is doing quite well overseas. Atari is doing well from what I hear, but I've also heard that they are failing in support and are being sold mostly as game machines.

Atari in the US has almost no support at all.

>Atari has very healthy markets abroad and just like commodore, Atari has
>yet to take advantage of the USA market.
>
Atari take advantage of the US market?! HAHAHAHAHA! Don't be so absurd! You know full well that it will never happen. Atari has lost their chance. Software companies are stopping their support, dealers are switching computers or going out of business...How many Atari owners live near an Atari dealer?

>If you want to do word processing, I hardly think you would have time to
>play a game at the same time. As for multi tasking, Atari multitasks
>REALISTICALLY. That is, if you want to print something out, or download
>something or do something else like play music that doesn't require
>your constant interaction there are plenty of options available to help you
>do these things in the background so you don't waste time so you can do
>something else..like play games.
>
>Really, multitasking is WAY overplayed by AMIGA people. They are not
>the only people who have multi tasking machines, its just that workbench
>supports this option automatically. While on the ST its an add on.
>

Here again is the words of someone who has never had a multitasking machine. First of all, the Amiga OS multitasks, but that is probably what you meant. You can't 'add on' multitasking to the ST, so stop decieving this poor guy who is trying to find out information. You can use things like Revolver to stop one memory partition and switch to another. this is not multitasking because you are doing one thing. YOu can use things like Masterlink (hahaha...if they ever come out with another version) to download in the backround, but that is pretty much the extent of it. You are alwasy very limited. And don't breath to hard while you are doing this, you might crash it!

I suggest anyone who is thinking of buying an ST look at the support available for both machines and DO use both machines. Take it from someone who owns both...You DON'T want to buy an Atari.

Is the STOS Ste fix available at any of the atari ftp sites.
If so please let me know at what site, and under what name.
If not, I'm sure it's PD so could someone upload it, as it is
pretty useful.

Also, I'll ask again, can anyone give me details of how to
build an ST Xformer cable, so that I can port to my old XL?

Thanx in advance,
Mark Keates.

1279. ST v Amiga all over again...

Newsgroup: comp.sys.atari.st
Date: 1991-02-07 16:42:01 UTC
From: bointon@kcl-cs.UUCP
Message-ID: <2005@xenon.kcl-cs.UUCP>
Source record: 234940

This is getting stupid.
We are right back to the same old arguments that STs and amigas have had ever since they were launched.
Does it really matter if one machine is better than another if your machine does precisely what you want it to anyway?
When it comes to what I want- I use an ST. I mainly do programming and music stuff, so I have an ISO Pascal compiler, an ANSI C compiler, and Steinberg Cubase v2 and a Lynex for sequencing and sampling.
This covers exactly what I want, The fact that it's an ST is almost irrelevant , apart from the Atari mono monitor which I have never seen bettered.

So if you're going to produce all this garbage about wonderful Amigas, can you please keep it to your own Amiga worshipping cult, and not inflict it upon those who actually use their machines instead of talking about them.

Marcus Bointon.

1283. Re: TSR programs

Newsgroup: comp.sys.atari.st
Date: 1991-02-07 19:11:37 UTC
From: rosenkra@convex.com
Message-ID: <1991Feb07.191137.2022@convex.com>
Source record: 234825

[question about doing computationally intensive things in background with a TSR...]

first, do u really mean TSR? a TSR is a program, ususally started at boot time, which remains resident in memory, and runs under special circumstances, generally when another "forground" program tries to access the OS. these programs are generally used for things like ramdisks, and to modify how TOS works.

i think you really want more a multitasking capability. here you have several choices. perhaps the easiest is to look into MiNT, a multitasking extension to TOS. it does not multitask GEM programs, only TOS programs (.ttp, .tos) as far as i know. what you can consider, however, is to build sort of a raytracing server which runs purely as a TOS program. it can be a TSR, but you will also need some form of interprocess communication between your main application and this server, probably. consider pipes or shared memory. at a minumum, you will need to tell the server to start/stop, and give it an image to render as well as whatever parameters are needed (light source, etc).

another solution is to write the raytracer as a DA, and send it messages from your application after some prescribed time (evnt_timer) like an alarm clock. it will only run, however, when u tell it to, so u will have to tell it often.

another solution, which i have used, is to multitask within an application itself. you can install things to be done in the background which take place at each vertical blank interrupt (VBL). this works well for things like disk formatters, and (in my case) doing lots of numerical calculations while you go off and do something else. i had written a program to generate and edit digital audio samples, and i used each VBL to do the sample generation. the tradeoff involves how much work to do during the VBL before things like mouse and keyboard start getting too sluggish. in your case, consider 1 ray/VBL as a start (or 1 pixel/VBL ?). the VBL technique works with GEM programs, too, but you are only multitasking within the application, so when u quit, the renderer goes away, too. you should be especially careful to clean up properly (de-install the VBL routine) when the application quits. i can't remember whether u can call XBIOS/BIOS/GEMDOS during a VBLANK. maybe someone can answer this (for me, too)?

you will be rendering to memory and not to the screen, of course.

you can find MiNT at atari.archive.umich.edu (terminator) as well as the library to roll your own VBL stuff. look for vbi*.arc or vbl*.arc for the latter. i think the VBL stuff is there, if not i can mail it. i think it was also posted some time ago.

sounds like an interesting little project. i hope this helps...

i have just posted some stuff which may help u. nroff v1.10p4 now generates vt100-ish escape sequences (eg ESC [1 m) which another program i posted (manpager) reads and uses to change fonts (mono only so far, monospaced font only so far). check it out. included are a bunch of 8x16 fonts to replace those in RAM (actually, all i do is change the line A pointer to the font data). i posted src, so this may get u going. it should appear soon (i sent it out a week ago). my plans with nroff are to eventually support proportional fonts (for laser printers and the screen) so that it will be more troff than nroff (for non-unix people, these are batch oriented text formatting programs under unix).

note that i also posted a bunch of tools to batch edit the .FED fonts i used, including a program to convert .FNT files (which come with MGR) into .FED files (which is the format used by TOS).

you can also consider GDOS, though i have no experience with it.

>Ever notice how it's always the Amiga owners who feel the need to press
>their Amiga-ST flame wars over to comp.sys.atari.st?? You'd think if
[...]
No, that's not true, although it might appear that way some times. What
usually happens is the same thing that happened this time:

Someone who doesn't know anything about either computer crossposts a
request for comparisons, and the denisons of both groups respond in an
escalating spiral of verbal hostilities. In each group it looks like the
other group is doing all the attacks, and it takes a long time for everyone
to calm down.

I think that a brief show of respect for each other will make life more
enjoyable for us all over the next week or two.

If anyone wants to actually argue there is an amiga group set aside for
that (note the followup). Otherwise let's try to be civil to one another
while this crossposting nonsense wears off.

1288. Hypercard-like program for ST's

Newsgroup: comp.sys.atari.st
Date: 1991-02-07 20:03:32 UTC
From: oddjob@oz.plymouth.edu
Message-ID: <1991Feb7.200332.4878@oz.plymouth.edu>
Source record: 234829

[This is most likely going to be a perenial question --]

I'm looking for some SOFTWARE product that will let me design
hypercard-like entities on my ST. I saw a notice for something called
Hyperlink here a few weeks back.... can anybody give any further info
about it ??

I'm not interested in Zoomracks (if it even still exists) and I'm NOT
going to go out and buy a Mac anytime in the next two years (not
because of some psuedo-computer religion much like the current Amiga
spoutings in this newsgroup. I like Hypercard on a Mac. I just can't
afford a second computer.) and I can't afford Spectre GCR (not with
a dying harddisk I'll soon be replacing).

SO.....
Does anybody have any pointers for a hypercard-like program
that has a "scripting" language like Hypertalk and that is portable
between the ST (or TT even) and Macs. (Portable means image and
scripting wise. I can understand XCMD's & XFNC's not being portable.

I am a new ATARI user who is full of questions. Hopefully some
of you can help me get started. There aren't any other ATARI users
in my area (that I know of) and the "good deal" I got didn't include
much documentation! Thanks in advance for any replies.

I need a description of the operating system. I would really like
to know how the desktop works, how files are managed, how
does the OS know what devices are connected, ect. Where can
I find one?

I have an ATARI 520ST with 500K ram (s/n# A11003969 - does that mean
anything to anyone???). What are my options for upgrading?

I have a printer that will not operate with the CENTRONICS cable (the
same printer/cable operate fine when attached to "one of those
other PC's"). How does the ST know if there is a serial or
a parallel printer attached? What is the correct cable
configuration to use?

What are my options for a hard drive? What type of HD am I looking
for? I now have two floppies - SS354's.

Is there a translation capability to read/write IBM & MAC 3" discs?

Are either of the monitors compatable with other PC's? I have a SM124
and a SC1224 as well. (e.g. I don't need two monitors,
simultaneously - could the one I'm not using be hooked as a
display for something else?)

Must I dismantle the unit to read the PROM version? Is there a way to
ask it? ...and what is the current version of the OS? If I don't
have the current version, how can I get it?

Thanks again for any help offered. I'm excited about the ST and
looking forward to becoming "more functional"!!

In article <1991Feb6.221439.2486@mailer.cc.fsu.edu> boyd@nu.cs.fsu.edu (Mickey Boyd) writes:
>Now the question: Is there a defragger that works with TOS 1.4's bigger
>partitions? You can go up to 32 megs!

Just a point of clarification. The reason for the 16 meg limit of TOS 1.0 and 1.2 is that TOS used a signed short integer for the sector address. This allows only 2^15 = 32,768 sectors to be addressed. Since each sector is 512 bytes, that works out to 16 meg.

TOS 1.4 uses an unsigned short integer, which allows 65,536 or 32 meg to be addressed.

HDX version 3.01 (Atari's hard disk driver) achieves large partitions another way. It restricts each partition to at most 32,768 "sectors" (I believe, to maintain compatibility across all TOS versions), but the logical sector size can be multiples of 512 bytes. Thus, if the logical sector size is 2048, then those same 32,768 sectors contain 64 meg of disk space.

Because there are two distinct ways of achieving partitions larger than 16 meg, there are two ways for a defragger to fail: (1) it may itself use signed short integers for sector addressing, preventing it from addressing more than 16 meg correctly, even if run under TOS 1.4, or (2) it may assume that the logical sector size = 512 bytes and fail to handle the longer logical sectors of HDX 3.01 correctly.

Hey Volkmar, you should try Spectre, it is great!

There is a chanse that the current version of overscan supports Spectre,
they are at least working on it. I'll get my overscan soon, then I am able
to tell. Still waiting for Spectre v. 3.0 to arrive... (I think that 3.0
works with the older overscan also)

1301. Mercury UUCP and uucico

Newsgroup: comp.sys.atari.st
Date: 1991-02-07 23:21:46 UTC
From: paulm@unix.UUCP
Message-ID: <124@unix.UUCP>
Source record: 234772

Well at least I managed to get the whole package, both binaries and
sources. One problem though. The host server I call into requires
two passwords! The sequence is login: password: system password:
I log in, issue the 1st password the pomptly logs me out when it
asks for the system password. The hosts file seems too regimented
as far as it's fields go. Is the dialer in the GFA basic uucico.lst
file? I hope not. I do not own the GFA basic compiler (I don't like
basic anymore :^)). If it is one of the other files, I hope it's
one of the MWC files since I don't have MegaMax either.
Can anybody help?
Oh, and another thing, I just got the spectra MAC emulator from a
friend of mine whos dropping his ST for a 486 PC. I got the hardware
(no GCR) and the ST spectre software bu NO spectre formatted System/
Finder boot disk. I also only have a single sided floppy. (I never
bothered to get a double sided one because I have a 380 meg hard disk
and a cartridge tape backup system). Also I didn't get any docs with
the spectre stuff. He 'missplaced' it somewhere and won't look for it.
Anyway, what I'm getting at, can anybody tell me how to make a boot
System/Finder single sidded disk in spectre format so I can at least
boot the MAC and then unsit the whole batch of other stuff I have
for the MAC?
Thanx in Advance, Paul Moreau

From: s37837k@saha.hut.fi
Message-ID: <1991Feb7.235717.14214@santra.uucp>
Source record: 234847

In article <2493@beguine.UUCP> Duncan.Lewis@samba.acs.unc.edu (Duncan Lewis) writes:
>
>1) Significance on the absence of a midi-thru port on the ST, anybody?

There is MIDI-thru in ST, I just don't know anybody who needs it...
It can be used with special cable or a small port-splitter.
I have never needed it.

>2) What cpu model is probably the best most economical but flexible one
>to choose, in terms of pricing, versatility, program compatibiltiy etc.

For musician I would say STacy, with at least 2Mb RAM and largest harddisk
available. If you don't need to carry it around, any will do. I would say
Mega4 or TT with big screen (19") is ideal, but rather expensive. MegaSTE is
also good for serious use. Only important thing is that the system has mono-
monitor and enough RAM & Disk-space. MIDI-stuff eats a lot.
I personally use a 1040STFM transferred to tower-housing, with 4Mb RAM and
170Mb harddisk. There is also a 16MHz accelerator. By the way, this tower
has MIDI-thru port also.

>3) Your opinion of general software for Midi use, brands, names anything will
>help.

I have tried many. The German firm Steinberg won the competition in my case.
I use Cubase 2.0 for sequencing & editing and Avalon for controlling & editing
sample(r)s. There is also a good universal instrument editor called Uniman.
It supports almost any well-known synthesizer/sampler. I have Ensoniq VFX,
being one of the main instruments I use, and there are no serious editors
for it other than Uniman. I bet there are other instruments with similar
situation. The Uniman is from Nederlands.
Only disadvantage in these is that these are propably the most expensive
applications there are. Cubase costs over 500 pounds in the UK...

>4) Why use an ST instead of the Mac or Yamaha/Casio etc.

Mac is a good alternative! But only Atari offers built in MIDI and
top-level software and hardware support for musician.
Still, Mac has all those fancy MIDI-applications, like Finale...

>5) Other interesting hardware implementations, like SMPTE equipment etc.

Those are offered by Steinberg also, for example. There are others also, but
they are not very familiar to me.
SMPTE is well supported with Atari. So is Sample-transfer via SCSI.

>6) What your setup is and how productive has it made you.

I already told about my ST and software. Here are the instruments:
My personal ones:
Ensoniq VFX, Korg M3R
Ones offered by sponsors and friends, etc.:
Korg T3, Korg WaveStation, Korg M1, Ensoniq EPS 16+, E-MU Proteus,
Akai S1000, SynthAxe.... and others not so frequently used.
I have composed & produced about four hours of music, same style like
Jarre, Vangelis, Kitaro, Blenner, Hammer...
I just need to master it to DAT and send it for someone to decide if
it will be released in a form of CD. It took about a year to do it.

>7) ANything of value you'r like to add including flames etc

Source record: 234846

I have a little sub-desktop a-la the TDI desktop for controlling some stuff. If I invoke a program from it that doesn't do the same number of "show mouse" and "hide mouse" operations, either because it's ill-behaved or it crashed, the mouse is screwed up when I get back to my sub-desktop. I've tried lots of things with GrafMouse, VDI and LineA to get the mouse cursor back to exactly zero "show mouse" / "hide mouse" parity. Nothing seems to work. (Yes, I think I've set the VDI / LineA argument that says "set hide mouse count to zero" correctly.) How does the desktop do it?

Thanks in advance for any information you're able to give me.

The 68030 and 68040 are obsolete because:
1. At the same clock rate, even the 68040 is less than half as fast as the 88000.
2. Motorola has only two REAL 680x0 customers left: Apple and Motorola. NeXT might pick up some slack, but not more than 2-3% in the foreseeable future.
3. Motorola has already announced the 88110, twice as fast as the 88000, with the CAMMU built in (not on a seprate chip).
4. Motorola has publicly boasted that 88110 will be operating at 200 Mhz by the end of 1992. They might not make it, but... I'd rather have a 200 MIPS single-chip computer than a 15-MIPS one.
5. Right now, 88xxx's are more expensive than 68xxx's, but that won't last forever.
6. Motorola has several REAL customers for 88xxx: Data General, Tektronix, Sequent, Opus, and, of course, Motorola.

I have recently bought Ace(e)x DM-9600M, a V.32 MNP 5 modem.
The problem is that I can not find correct settings for it.

The remote-ends are USR 2400e, USR Courier HST DS and a Nokia V.32 MNP 4
modems. Mainly these.
So I would like to set my Acex so that it uses locked terminal baud rate
(19200bps) with RTS/CTS or XON/XOFF flow-control and error-correction
MNP class 4-5. The problem now is that the connection is unstabile.
Even with MNP on, there are marks missing, replaced by others (like $-sign)
or strange marks appear from nowhere. Strangest is that those responses that
modem sends to the terminal are corrupted. OK turns to be just K.
CONNECT 9600T/REL COMPRESSED may become CONECT 9600T/REL COMPESD.
I use this modem currently with 286 AT, and it will be mainly used with
Atari ST. I have only once tried it with ST before, and then it acted
normally. (seemed to, no MNP & stuff related was used)

Any advice, a list of correct settings would be highly appreciated!!!

Email or followup, which suits you better...

inability. I have one meg of video ram and two of fast, and I have not run into
any memory problems yet, certainly not any problems with video ram.

> three chips called the Agnes, the Blitter, and the Portia). These same chips
^^^^^^
What the h*ll is Portia, you really need to get your facts straight, there is no
Portia chip.
> are responsible for the multitasking power of the Amiga. The 68K CPU is free
Don't forget to give credit to the operating system, and the CPU, they also play
a very important part in the Amiga's amazingly powerful system.

> to attend to other operations while Portia handles the port accessing, and the
> Blitter and Agnes operate the graphics and sound.
Again, read a book and get your facts straight, and remember label the proper task`
with the proper chip, and to include other chips like Gary and Denise, they are
important too.
Every limitation on the
> Amiga is due to these three chips, which Commodore has been slow to revise and
> upgrade. The only exception being the new 'Fat Agnes' which can access 1 meg
> of video memory at a time, and the new ECS (Enhanced Chip Set).
Don't for get to include Buster, and Super Denise with her amazing programmable
dispisplay modes, you seem to be leaving quite a lot out, and not getting what is
here corect.
While a slight
> improvement, the only thing I can remember about the new capabilities is the
> ability to run Viking Moniterm resolution in 4 colors. There is also a 50MHz

> exact number). ^^^^^^^^^^^^^
You make it sound so trivial, it's actully 1.7 gigs, and it's a whole lot!!
.
You should both get your facts straight, and read industry-
> wide publications instead of product specific publications. Every system has
> it's limits. Read Byte instead.
> Chris Winward
> userid CXW148 on PSUVM

You should make your words short and sweet, I sense that you may have had to eat them
in the past. YOU should readup on what YOU are talking about, go beyond byte, pickup
or borrow a hardware manual, they are much more informative.

I'd like to state the 'unofficial' (read my) opinion of the whole thing,
before it gets out of hand. The file saddam.lzh was uploaded by a trusted
uploader who wanted to make this file available to anyone who would
be interested in it. I don't feel it is appropriate for the moderators
of an archive to state their political positions under these circumstance,
so I won't bother.

I'm sure each of us has our own opinions concerning the situation, but
this is not the place for such discussion. The file is provided
as a service to those who want it, and is not intended to degrade
any person's heritage, or promote said racial bigottry.

I respect your opinion David, and encourage others to voice theirs in the
appropriate arenas. However, the file will stay in the archive.
I would view anything else as blatent censorship, and I will have no part
of that whatsoever.

If anyone else has concerns about this file, please voice them directly to me
weiner@terminator.cc.umich.edu or jeff_weiner@ub.cc.umich.edu.

>appreciated.

FTP is a short for File Transfer Protocol. FTP is used to move files via nets
from machine to another. Those numbers are an address. All machines have
their address in both numbers and letters, for example I am on a machine
called saha, saha.tky.hut.fi now (saha is finnish and means saw, like jiggsaw)
there is also a numerical form for that address.

In Unix, to use FTP, simply type FTP. (first see: man ftp)
Or type FTP <address>.
A widely used method is anonymous FTP. You can download PD to your machine
from various servers. When FTP asks your login-name, type "anonymous".
Then it asks your password ads asks you to send your indent as a password.

But FTP is a big thing, try man ftp or try to get some printed instructions
to use it.

Interesting. A few months ago I bought a used copy of the prospero
fortran compiler, and there's a program PRL that you're supposed to
run before running any of the other stuff. I think PRL is ram resident
library stuff. Anybody know what Spice.lzh was written in?

1314. Trouble with 1040ST Floppy Disk

Newsgroup: comp.sys.atari.st
Date: 1991-02-08 02:40:57 UTC
From: vsnyder@jato.jpl.nasa.gov
Message-ID: <1991Feb8.024057.1902@jato.jpl.nasa.gov>
Source record: 234911

We've had no end of trouble with the Floppy Disk on a 1040ST, about 3 years old now. It gets lots of errors, occasionally munges a disk, and won't re-read the directory when you mash ESC. The dealer replaced it once. We've tried putting the monitor far away (as far as the cable will reach), and putting a shield (grounded window screen) between the computer and the monitor. No help. Anybody have ideas?

Thanks in advance for any help you're able to give us.

Hey, get a TT or MegaSTE 4 if you are going to do comparings like that.
I am not either comparing my 16MHz 4Mb ST to C64!!!!

>Amiga is doing quite well overseas. Atari is doing well from what I
>hear, but I've also heard that they are failing in support and are
>being sold mostly as game machines.

In Europe, especially Germany, and UK, and France too, Atari is doing
wery well indeed. Atari is the #1 computer in Germany. And #2 in Finland.
#1 is Amiga, over 80% of users are kids playing games, but almost the
same percentage of Atari-users use their machines for studying & productivity.

>Atari in the US has almost no support at all.

That is a well-known and unfortunate fact. Hope MegaSTE and TT will go better.

>Atari take advantage of the US market?! HAHAHAHAHA! Don't be so absurd!
>You know full well that it will never happen. Atari has lost their chance.
>Software companies are stopping their support, dealers are switching computers
>or going out of business...How many Atari owners live near an Atari dealer?

A 3000 never did those headlines as TT and MegaSTE! If you keep up laughing
like that in here, we'll laugh you out! Kill!

>machine. First of all, the Amiga OS multitasks, but that is probably
>what you meant. You can't 'add on' multitasking to the ST, so stop
>decieving this poor guy who is trying to find out information.

Have ever used Atari under Unix? I have. Compared to that, Amiga's
multitasking is like dancing in a chamber full of sticky honey...

>I suggest anyone who is thinking of buying an ST look at the support
>available for both machines and DO use both machines. Take it from
>someone who owns both...You DON'T want to buy an Atari.
>
I also use both machines, I am even a co-sysop in a well known Amiga-BBS.
My opinion is that unless you have loads of money, you can't get yourself
a Amiga that has much future ahead.

Get TT or MegaSTE. Or Mac. Or 386/486 +Win3 (or Unix & X-Win).

Atari-users do it firST, and are hoTTest in STEady markets...

There have been a couple of answers to this question already, but I
am not sure that they answered the question that was asked. The way
I read the question, there is another easy answer: Simply use the
desktop to drag the files to another directory, removed the files
from the first directory, and then drage the files back.

>filled with the same kind of shit you've written here...

Take a look at the header. You've already done that. These articles
were CROSS-POSTED meaning both groups get this crap. The Amiga gets it by
far the most with the Mac vs Amiga, ST vs Amiga, NeXT vs Amiga flames that
pop up constantly.

>Buy an Atari. There are few big advantage above others:
>
> ST/TT-users are definitely not like those fanatic maniacs that
> would defend a jar filled with shit, if there is the word Amiga
> printed on it...

You mean like you?

> ST/TT-users don't attack people who dare to use a computer that
> is something else than ST/TT. They are a one big happy family
> that gives advice to everyone without asking what computer they
> use, or if they are using any...

Yeah right. Dream on. On local bbses in my area, there are ST users that
call AMIGA boards to start wars. Every computer has its example of fanatics,
and your a fine example.

> ST/TT users don't deal people to groups according to their skills
> in computing. In Amigaworld, those mystical expert-user groups with
> mostly under-aged users in charge hide behind funny names and
> keep their organizations up by buying other people's souls using
> pirate-software as a currency.

Hahhaha! The ST has more rampant piracy than any computer in existence!
In Europe there are hundreds of ST pirate groups.

>So, I think there is nothing wrong in the machine itself, it is just ment for
>a bit different kind of use that ST. But there are users that make Amiga
>look dirty. (there are such ST users also, but we wont let them loose...)

Oh sure, I bet all those ST pirates/fanatic obey you fully. How do you
propose to keep st users from 'letting lose'?
People will do as they please.

>I don't care which machine you buy, Amiga is an expensive toy and Atari,
>especially with latest releases, is rather a cheap tool.

Hahah...The ST has an even bigger game image then the Amiga! Get real.

>Do you know any serious, famous musician using Amiga? I don't.
>Do you know any serious, famous musician using Atari? I do, in fact too many
> to count...

B.B. King!
Lets rephase this question:
Do you know any serious, famous video/movie company using the Atari for Video?
Do you know any serious, famous video/movie company using the Amiga for Video?
Tons. Whats the biggest rage in the Video world? The Video Toaster!

Th Amiga has better sound than the ST. The only thing the ST has is
MIDI. Granted there is not much MIDI software on the Amiga's market,however
the few packages that are availible are powerful. You can multitask
Sequencers, Arrangers, Composers, and Video all at the same time, and
synchronize Music to Video.
The Amiga could be used to produce a music video, the ST could not.

I used to use an ST everyday (at a friends house, to play games) He tried to
get me to buy an ST. When I bought my Amiga, within a week his ST was up
for sale, now he owns an A2000.

>
> Jartsu
>

Was I obnoxious? Yes..But I am SICK and TIRED of these constant
XXX vs Amiga flames (except when they are in .advocacy!)

If ST users wish to continue this, please join comp.sys.amiga.advocacy,
and remove c.s.atari.st and c.s.amiga.misc from the newsgroups line.

dond@gold.gvg.tek.com (Don Davis)
writes:

I am a new ATARI user who is full of questions. Hopefully some
of you can help me get started. There aren't any other ATARI users
in my area (that I know of) and the "good deal" I got didn't include
much documentation! Thanks in advance for any replies.

I need a description of the operating system. I would really like
to know how the desktop works, how files are managed, how
does the OS know what devices are connected, ect. Where can
I find one?

I have an ATARI 520ST with 500K ram (s/n# A11003969 - does that mean
anything to anyone???). What are my options for upgrading?
I have a printer that will not operate with the CENTRONICS cable (the
same printer/cable operate fine when attached to "one of those
other PC's"). How does the ST know if there is a serial or
a parallel printer attached? What is the correct cable
configuration to use?

What are my options for a hard drive? What type of HD am I looking
for? I now have two floppies - SS354's.

Is there a translation capability to read/write IBM & MAC 3" discs?

Are either of the monitors compatable with other PC's? I have a SM124
and a SC1224 as well. (e.g. I don't need two monitors,
simultaneously - could the one I'm not using be hooked as a
display for something else?)

Must I dismantle the unit to read the PROM version? Is there a way to
ask it? ...and what is the current version of the OS? If I don't
have the current version, how can I get it?

Thanks again for any help offered. I'm excited about the ST and
looking forward to becoming "more functional"!!

Well, as for your first question about operating system information you
might want to try investing in Mark Williams C. The compiler kinda sucks,
but the documentation shows you how to do almost anything you want on your
ST with complete working programs...I learned most of my knowledge by typing
in all the examples myself...and screwing around with them in all sorts
of ways.

As for your upgrade question, icky poo. 500K? With MWC you will want at least 2.5 megs so you can make a RAM disk to keep your CC files in OR ELSE you will be sitting waiting all day for a compile to complete.
(I think most will agree Zubair 3D is a fine memory upgrade I loved mine)

As for the printer, the ST doesn't explicitly have to know if the printer it self is serial or parallel, you simply plug it into the germaine port.
(You didn't sy anything whether the printer was serial or centronics)

As for the hard drive options, I would go with:

#1 Choice is ICD drives. (They look neato and are easily expandable)
(Did I mention they are fast too?)

#2 Supra is an excellent drive too.

#3 Yes, then we have Atari's MEGA file series comming in third...they look better on the outside than on the inside. :)
(Although! My Mega STe's drive IS NO SLOUCH and is comparable if not faster than an ICD setup (157N).

As for the floppies, EGADS, I suppose they are useful, but you really should sell both and get a SF314. FORGET MWC if you have 500K and two floppies as a working development/exploration system.

The monitors, Mmmmm, I am not sure about THAT. Let someone else answer that question...it would be a pain I would guess though...

As for the ROMS, if you have version 1.0, Great HornyToads, get to your dealer and have them order the NEW RAINBOW 1.4 TOS, otherwise half your hard disk performance is GONE. (I mean, you wouldn't want to spend all that money on a fast ICD drive and then hook it up to TOS 1.0 would you now?)

In my long winded conclusion, have fun! Goodluck in your TOSLand pursuits.
And remember, a hppy program is one that does what TOS tells it too.
(Except if its TOS 1.0)

As long as you are cross-posting misleading information
(if you didn't realize, look at the Newsgroups: line of your
message, you sent into to both ST and Amiga groups), let me
`clarify' things.

True, the A3000 is only 25MHz, although you can go to
18MB on the motherboard and more on cards. However the 33MHz on
your ST is NOT from Atari, but rather with 3rd party equipment.
Therefore it is fair to consider what can be done on the Amiga
with 3rd party equipment, and for appr. 8 months GVP has been
shipping a 50MHz 030 card for the Amiga 2000, so you don't have
to wait.
Besides, once the 040 starts getting more widespread
50MHz 030s will be a dead issue. The 040 will be the hot issue
and the Amiga (and I assume the Atari too) will be getting addon
boards probably within 3 months.

There were never any Amiga users in this group. Perhaps you should try
and read the manual on your newsreader, refer to the section on CROSS
POSTING!

I think your acting overly immature to a simple arguement, no need to
scream jibberish and profanity.

> ^^^^^^
>What the h*ll is Portia, you really need to get your facts straight, there is no
>Portia chip.
Portia=Paula! The Amiga chips were renamed when the Amiga500/2000 were made.
Portia=chip that controls the ports. (the name fits the function) The
Denise chip originally had a different name too.

>> are responsible for the multitasking power of the Amiga. The 68K CPU is free

>> Blitter and Agnes operate the graphics and sound.
>Again, read a book and get your facts straight, and remember label the proper task`
>with the proper chip, and to include other chips like Gary and Denise, they are
>important too.

Well, the original message did have some facts wrong, but it is essentially
correct. Portia (Paula) handles Sound, and Agnus plays an integral part
is Sprite DMA, BitMap DMA, DISK DMA, Sound DMA, etc. And the Copper is
located in Agnus. So it can be said that Agnus handles graphics and
sound (and everything else) , however Denise is specialized in display
output, and Portia(Paula) in sound/ports.

>> Amiga is due to these three chips, which Commodore has been slow to revise and

Nor Amber,RAMsey, Super DMAC, and Gary!

>.
> You should both get your facts straight, and read industry-
>> wide publications instead of product specific publications. Every system has
>> it's limits. Read Byte instead.

The real limitation of the Amiga is the speed of the chip bus. Once
the 16bit/NMOS bottlenecxk is overcome, the custom chips can once again
take the lead in the industry, however, I really don't see the need to
keep making new custom chips, the real work needs to be done in display

independence.

>> Chris Winward

>You should make your words short and sweet, I sense that you may have had to eat them
>in the past. YOU should readup on what YOU are talking about, go beyond byte, pickup
>or borrow a hardware manual, they are much more informative.

While the original poster made a few mistakes, he was essentially correct.
You made a few mistakes too so don't get so high on your horse. Everyone
makes mistakes. (And Portia is a REAL CHIP!)

Your ignorance of the Amiga is shown by the complete bullsh*t you
continually post!
The Amiga has PLENTY of 33mhz and even 50mhz 68030 cards availible.
They have been availible for a long time! and unlike the ST, the
Amiga's OS doesn't crash 68030s! (TOS won't run on 68030's without a patch
because of the privileges instructions it uses).

The Amiga 3000 can hold 18mb of ram on the motherboard and is expandible
to 1.7 gigs!

>
> TT, the emperor of comp-world, and the high council of STs and STEs

[Sorry for the followup, net.public, but this guy bugs me.]

In article <1991Feb7.222920.13058@santra.uucp> s37837k@saha.hut.fi (Jari Lehto) writes:
>AMIGA-USERS, GET THE HELL OUT OF THIS NEWSGROUP!!!!

Er, did you bother to check the Newsgroups line?
BTW, here in c.s.amiga.* we have a newsgroup for this kind of stuff, so please honor the Followup-To line.

>or I will definitely come and mess up yours with hundreds of articles
>filled with the same kind of shit you've written here...

...which is a great way to get your USENET access revoked.

>Buy an Atari. There are few big advantage above others:

The Atari _does_ have some advantages, but I Jari fails to mention any of them.

> ST/TT-users are definitely not like those fanatic maniacs that
> would defend a jar filled with shit, if there is the word Amiga
> printed on it...

Well, so far this guy's making good on his threat -- and then some...

> ST/TT-users don't attack people who dare to use a computer that
> is something else than ST/TT. They are a one big happy family
> that gives advice to everyone without asking what computer they
> use, or if they are using any...

That may be true of most ST/TT owners, but I bet the net.public can name _one_ ST/TT owner who attacks owners of other computers. [:-)] I think you'll find the general c.s.amiga.* readers to be pretty decent, helpful people, too.

> ST/TT users don't deal people to groups according to their skills
> in computing. In Amigaworld, those mystical expert-user groups with
> mostly under-aged users in charge hide behind funny names and
> keep their organizations up by buying other people's souls using
> pirate-software as a currency.

[This is the part that made me laugh, BTW.]
I don't see where this guy comes off saying something like this. There are no "mystical expert-user groups" in existance. The users groups I've seen and been a member of were all _very_ good about helping out new users. The group at my university has a small number of so-called "expert users" who are happy to help out the novice users. No exchange of pirated software occurs at these meetings. Such things are not only against the law, but they are

against the rules at the university and they are against the bylaws of the club.

Frankly, (and to be truthful this is only hearsay) I have been told that the about of piracy going on in the Atari market is much higher per capita. It's certianly nothing to brag about.

>So, I think there is nothing wrong in the machine itself, it is just ment for
>a bit different kind of use that ST. But there are users that make Amiga
>look dirty. (there are such ST users also, but we wont let them loose...)
>
>I don't care which machine you buy, Amiga is an expensive toy and Atari,
>especially with latest releases, is rather a cheap tool.

Correct. The Amiga and the Atari are designed to do some things better than other machines. The BANG/BUCK ratio is about equal, IMHO. If all I was interested in was MIDI, I would have bought an Atari. Since I'm interested in music (usu. _not_ MIDI), video, real-time graphics applications, etc., I bought an Amiga. I paid more, and I feel that I made the right choice.

BUT THAT WAS MY CHOICE! DON'T THINK THAT I AM TRYING TO DICTATE TO YOU WHAT MACHINE IS BEST!

>Do you know any serious, famous musician using Amiga? I don't.

I'd have to check back in a few recent c.s.amiga.* posts, but I believe I heard something about Robert Plant and someone else using the Amiga for MIDI. I also heard something about a musician who dropped his Mac system and bought into the Amiga in order to produce his music video. [Someone who remembers this better than I please help me out here.]

>Do you know any serious, famous musician using Atari? I do, in fact too many
> to count...

I know of a few musicians using Ataris. I know of a whole helluva lot of them using the Mac. Why, you say, would someone use a Mac for MIDI? Well, there _is_ a lot of _very_ decent MIDI software available for it. I don't think it's an exaggeration to say that the Mac could do MIDI as well or better than the ST or Amiga, simply because the software developer makes more money from the Mac market and decides to work harder on updates, etc. The advantage to using an Amiga or ST is the low price.

BTW, replace the words "famous musician" in your questions with the following and ask them again. These may make you realize that the Amiga and the Atari are not competitors simply because they do _different_ things.

1) cable company
2) video effects engineer
3) home video fanatic
4) movie effects crew
5) world-wide news network
6) virtual reality designer

For the Amiga, I can provide some answers...

1) Too many to name. For one, Austin Cablevision here in Austin, TX.
2) Again, too many to name.
3) Ditto for #3.
4) The infamous Robocop 2 scenes that apparently got cut, for one.
5) CNN. [Yes, the familiar "Cleared by U.S./British/Israeli/Iraqi Military,"
along with the rest of the genlocked graphics, are done by an Amiga.]
6) Quite a few. Post anything about VR and see what percentage of people
interested are using Amigas. I'll be on the list...

Anyway, my point is that both machines have their good points. Please don't
post saying that the ST/TT is "so much better" and proceed to list a lot of
BS points that are supposedly bad about the Amiga.

I've been carrying on a nice, rather educational conversation with an Atari
owner for quite some time. I have learned quite a bit about the Atari, and
I know its good points. I also hope I've supplied some useful/educational
info on the Amiga to this person. All in all, I don't think either one of
us feels "superior" or "envious" about the other's machine.

Outrageous flaming is not a way to deal with the differences between machines.
Please stop using this tactic.

Greg

I think the fellows problem with 'cat' in Gulam is that cat loads the file into memory before displaying it. Therefore if it runs out of memory, it just doesn't display it. For some reason, ue often works.

1330. Spectre 3.0 - Re: Autoswitch-Overscan

Newsgroup: comp.sys.atari.st
Date: 1991-02-08 07:51:00 UTC
From: carter@cat27.cs.wisc.edu
Message-ID: <1991Feb8.075100.8175@daffy.cs.wisc.edu>
Source record: 234925

OK here is the goo on Spectre 3.0: Enjoy it I sure did!

Spectre 3.0 Release Notes

KEYBOARD DRIVER

The new keyboard mapping is as follows:

F1 Mount drive A
F2 Mount drive B
F3-F10 Mount hard drive partitions 1-8

Shift-F1 (unused)
Shift-F2 (unused)
Shift-F3-F10 Mount hard drive partitions 9-16

Control-F1 Color, Scrunch mode
Control-F2 Color, Scroll mode
Control-F3 Color, Top of scrolled screen
Control-F4 Color, Bottom of scrolled screen
Control-F5 SLM804, ImageWriter emulation ON
Control-F6 SLM804, ImageWriter emulation OFF
Control-F7 SLM804, Force formfeed
Control-F8 SLM804, Dump buffer contents
Control-F9 SLM804, 72 dpi rotated screendump
Control-F10 SLM804, 300 dpi screendump

Alternate-F1 Mac Plus emulation
Alternate-F2 Mac 512Ke emulation
Alternate-F3 SCC/VIA patches ON
Alternate-F4 SCC/VIA patches OFF
Alternate-F5 Orwell's disk monitor ON
Alternate-F6 Orwell's disk monitor OFF
Alternate-F7 Turbo disk mode ON
Alternate-F8 Turbo disk mode OFF
Alternate-F9 Debug mode ON
Alternate-F10 Debug mode OFF

(the Alt-Ctl-Fx keys are only active in Debug Mode)
Alt-Ctl-F1 SLM804 hex dump
Alt-Ctl-F2 SLM804 hex dump OFF

Alt-Ctl-F3 Disk messages ON
Alt-Ctl-F4 Disk messages OFF
Alt-Ctl-F5 Line-A tracer ON
Alt-Ctl-F6 Line-A tracer OFF
Alt-Ctl-F7 Debug to printer ON
Alt-Ctl-F8 Debug to printer OFF
Alt-Ctl-F9 Bus Error messages ON
Alt-Ctl-F10 Bus Error messages OFF

ESC Same as keypad Clear (this results in a true ESC code)
UNDO Same as Command-Z (normally UNDO menu entry)
DELETE Same as Command-X (normally CUT menu entry)
INSERT Same as Command-V (normally PASTE menu entry)
CLR/HOME Same as Command-C (normally COPY menu entry)
HELP Same as Command-? (normally HELP menu entry - if available)

Shift-HELP Calls up configuration page

Alternate-Control-Clr/Home Parks all hard disks

Alternate-Control-Delete Warmboot (stays in Mac mode)
Alternate-Control-RightShift-Delete Coldboot (back to ST mode)

As is expected, the keypad and arrows now work as they do on a real Mac (including the shift-, command-, and option- versions).

The configuration page now reflects any changes made via the function keys (this includes machine type, ImageWriter emulation, and SCC/VIA patches).

Applications which return the keyboard type now correctly report the keyboard as a Macintosh Plus keyboard. Also, the problems with the Calculator DA with the keypad have been fixed.

Note: non-U.S. keyboard may not work properly when Spectre is in Mac 512Ke mode (as opposed to Mac Plus mode).

SOUND MANAGER

The Macintosh Sound Manager (introduced in System 6.0 and Hypercard) is now supported. This means HyperCard sounds and alternate System Beeps (in the 'Sounds' CDEV) will work. Due to the differences between the Mac and ST hardware, some sounds may not sound quite right - most notably the 'Cling-Klang' and default beeps. The vast majority of sounds should play just fine.
You will also notice a slight pause the first time a System Beep is sounded. This is necessary to ensure compatibility with all current and future System versions.
If a MegaTalk board is installed, all sounds should sound correct.

Note: when using a color monitor, you might see an occasional flickering dot on the screen as a result of this - this is normal.

SOUND DRIVER CHANGES

Setting the sound volume to 0 in the Control Panel (in the General CDEV or the Sound CDEV) will disable sound. Mac applications will not be able to override this.

SLM804 CHANGES

Page buffer is now cleared following a 300 dpi (straight) screen dump.

CONFIG PAGE CHANGES

The Spectre config page now displays on all monitors, both standard and non-standard (Spectre 2.65 only displayed the config page on a standard Atari monitor).
The config page is also now available in 832K mode. Due to memory restrictions, in 832K mode, Spectre must request 32K of memory from the Mac OS to use as a screen buffer. If 32K is not available, the config page will not appear. If this occurs, quit back to the finder to release some memory and try again.

SERIAL DRIVER CHANGES

The advanced control call for setting the baud rate (csCode=13) is now supported. This should fix CDC Connect (and another CDC program) and any other terminal program which may be using this call.
Several minor changes have been made to the serial driver which may improve compatibility with some applications (such as the Async LaserWriter driver - see comments in the 'Bug Fixes' section).
Due to some slight hardware incompatibilities, if you wish to use the Asynchronous LaserWriter driver (or other application which uses async. serial I/O), you need to turn on the 'Async. serial/printer' option on the config page. Be advised, though, that having this selection on can cause a significant slow-down in programs which do not use async. serial I/O (such as dot-matrix printer drivers).

68020/68030 SUPPORT

CPU type is automatically determined by Mac OS. The Spectre code has
been modified to work with any of the 680x0 family of CPUs.
Mac applications which check the CPU type will know which CPU is
installed.
ZEUS II has been introduced to handle Bus Errors on the 68010, 68020,
and 68030.

68881/68882 SUPPORT

The 68881/882 in the Atari TT, the Gadgets' 68030 SST, or other 68020/
68030 accelerators is now supported for Mac use. This does not include
Atari's 68881 expansion board (SFP004) for the Atari Mega, which interfaces
the 68881 chip in a manner which is exclusive to the Atari.

IMPROVED MONITOR SUPPORT

Spectre can now handle monitors of virtually any size automatically.
This includes standard ST, Moniterm Viking, ISAC (monochrome mode), Matrix,
TT High Res (1280x960). Overscan mode is not yet supported due to the
non-standard software requirements.

DISK DRIVERS (floppy & hard disk)

Spectre now does a better job of informing the Mac whether a disk is
in the drive. This was causing problems with Apple File Exchange and can
be seen with SUM II (look at the Drive Queue).
The size of a drive as shown by SUM II, Norton Utilities and a few other
utilities is now correct.
MacEnvy II and other programs which check the drive type will now think
the floppies are FDHD drives (SuperDrives) controlled by a SWIM controller
and should know the hard disk partitions are not 400K floppies. This
should eliminate the problem of hard disk backup programs converting a
hard disk partition into a 400K MFS partition.

FLOPPY DISK DRIVER

The floppies now function as SuperDrives (minus the 1440K mode) and can
read/write MS-DOS (not ST) disks with programs that support it. DOS
Mounter and Apple File Exchange work as they should.
Using Apple File Exchange, you may format 720K MS-DOS disks which are
usable by Apple File Exchange, DOS Mounter, AccessPC, and directly in ST
mode.
Aladin disks are also supported. There are options in the CONFIG page

to select which format (Spectre or Aladin) to use on each drive. There is also a CONFIG page option to select whether the Aladin disks are 9 sectors per track or 10.
The icon for MS-DOS and Aladin disks is a floppy disk without a Mac Plus or Spectre logo.
If you get a disk failure on an MFM formatted floppy, Spectre will not drop into GCR mode. This means if you insert an ST/MS-DOS disk, you will get the format dialog much quicker.
The in-line formatter now supports Spectre format. You can format a Spectre disk by holding down SHIFT when the format operation begins. If you are using a Spectre 128, you will get Spectre format automatically.
The floppy disk cache has been removed entirely (to free up some more space).

NOTE 1: Only double-sided MS-DOS and Aladin disks are supported.

NOTE 2: You can only mount MS-DOS disks with DOS Mounter or AccessPC. MS-DOS disks can be read from and written to using DOS Mounter, AccessPC, or Apple File Exchange.

HARD DISK DRIVER

The hard drive read/write code has been TOTALLY rewritten to provide 68020/030 support.
You can now park all attached hard disks by pressing Alt-Ctl-Home. All hard drives must have been ejected prior to doing this (if any HDs are mounted, the park function will be inoperative).
Once you've parked the HDs, you will be able to continue using the computer, but will be unable to mount any HD partitions. Parked HDs need to be powered down before they will be usable again.
The Mac OS now knows that Spectre hard disks are actually hard disks and not floppies. You can now select "Erase Disk" to erase a hard disk properly. Also, dragging a floppy disk icon to a hard disk window will create a folder on the hard disk like it is supposed to.

Spectre partitions which support saved parameter RAM/Config page settings will have the type 'OOP' instead of the previous 'ACK' (which is still supported but can't handle the saved parameter RAM/Config page data). See 'PARAM RAM/CONFIG PAGE SAVER' section for further details.

Note: Atari TT SCSI drives are not yet supported. ACSI drives connected to the DMA port work fine, though.

PARAM RAM/CONFIG PAGE SAVER

The parameter RAM (holds your control panel, Map CDEV, and Sound CDEV settings) is now saved, along with your CONFIG PAGE settings. To use this

feature, you must use Spectre 3.0 to reformat your boot partition so that the space needed for saving this data is reserved.
If the hard drive partition you have selected to boot from is an 'OOP' partition, the PARAM RAM/CONFIG PAGE data will be loaded from that partition. If the partition is an 'ACK' partition, or if you don't have a HD partition selected to boot from, the PARAM RAM/CONFIG PAGE data will be loaded from the first enabled 'OOP' partition.
If you're confused about 'ACK' and 'OOP' partitons, there's a simple rule. Partitions formatted with Spectre 2.65 or before are 'ACK' partitions. Partitions formatted with Spectre 3.0 and above are 'OOP' partitions.

Note: There are no provisions for saving this PARAM RAM/CONFIG PAGE data to floppy disk.

MEGATALK SUPPORT SUPPORT

Selecting 'MegaTalk' in the 'Printer' menu (see below) causes the 2 serial ports on the MegaTalk board to be used as the Mac serial ports. If a MegaTalk board is present, the SCSI port on it will automatically be enabled allowing the use of any Mac SCSI device and software. Keep in mind that the Spectre launcher only shows devices connected to the ST's DMA port. The SCSI port is virtually identical to the Mac Plus both electrically and functionally (i.e. the function keys for inserting and ejecting Spectre hard drives does not apply).
If there are any bootable SCSI devices attached to the MegaTalk board, they have priority over Spectre hard disk partitions when booting.

VERTICAL BLANK

There are now two settings for vertical blank (selectable in the CONFIG page): REAL and SIMULATED. The two modes offer different pros and cons, so you should select the one appropriate for the work you are doing.

REAL Vertical Blank (used in Spectre versions prior to 2.65)
PROS: 1. Vertical blank interrupts are synchronized with the screen (some animation/games rely on this).
2. Vertical blank won't interfere with the SCC chip on the MegaTalk board. The prevents lost data.
CONS: 1. When using a monochrome monitor, any software which uses vertical blank for timing will be inaccurate. This affects sounds which will be higher pitched than normal (like Spectre versions prior to 2.65), benchmarks, and some other time-based software.

SIMULATED Vertical Blank (used in Spectre 2.65/2.65c)
PROS: 1. Application which use vertical blank for timing will be

accurate (sounds will be the correct pitch and benchmarks will
be correct).
CONS: 2. May interfere with applications which use the SCC chip on the
MegaTalk board (AppleTalk and MIDI).

For the most part, SIMULATED vertical blanks can be used for general
use. If you are using a MegaTalk board, it is likely you will need to
select REAL vertical blank to prevent interference with MIDI.
This can all get a bit confusing. If you're completely lost, try them
both and see which one works for the programs you are running.

Note 1: Coda's Finale can use MIDI in either mode. Most other MIDI
applications require REAL vertical blanks.

Note 2: Opcode's Vision will play MIDI music too fast when using REAL
vertical blanks with a monochrome monitor. The work-around is to
simply decrease the tempo slightly.

Note 3: The speed of the REAL vertical blank is determined by the monitor
plugged into the ST's monitor port. This is important if you are
using a Moniterm, ISAC, or other display system which doesn't use
the standard monitor port.
A color monitor will result in a 60 HZ vertical blank (in the U.S.,
50 Hz in Europe) and a monochrome monitor will result in a 71 Hz
vertical blank (worldwide).

64K ROM SUPPORT

64K ROM support has been eliminated. It hasn't worked since Spectre
1.9 anyway. We got VERY FEW complaints (maybe 2 or 3) and we needed the
space.

NEW LAUNCHER

The ST-mode launcher has been reworked with many changes to the menus:

SPECTRE 3.0g1: This menu entry now reflects the Spectre version number.
The 'Spectre 3.0' dialog now indicates whether a MegaTalk board is
installed.

FILE: 'Spectre' and 'Quit' positions were reversed to conform with the ST
"standard" for the 'File' menu.

Note: ^Q is the keyboard equivalent for Quit regardless of the language.

MEMORY: sizes shown are "legal" Mac memory sizes. Any size too big for the
current machine/configuration is greyed out. The last size on the list
is the absolute maximum memory size supported by the configuration and
may not equate to a real Mac size. STs with 3 Megs of memory are now

supported.

Note 1: you'll notice that on machines with more than 1 Meg, the max. memory size is 64K larger than before. This was an error in previous versions.

PRINTER: there are three choices for using the ST ports:
1. 'Parallel' directs the Mac printer port to the ST parallel port.
2. 'Serial' directs the Mac printer port to the ST serial port.
3. 'SLM804' directs the Mac printer port to the ImageWriter emulator for the SLM804.
There is one MegaTalk choice:
1. 'MIDI/Serial' directs BOTH the Mac printer and modem ports to the corresponding MegaTalk ports. When this is selected, the ST's parallel and serial ports are inoperative.

The MegaTalk menu entry is disabled if a MegaTalk board is not installed.

Note: you MUST select 'MIDI/Serial' for most MIDI applications to function properly.

PARTITIONS: This menu displays all available Mac/Spectre hard disk partitions and lets you select the one you'd like to boot from. Up to 16 partitions are allowed and displayed.

You can select the partition you wish to boot from by clicking on it. A checkmark will appear next to its name in the menu. If you click on the currently selected boot partition, it will be deselected and when you go into Mac mode, you will be able to boot from any drive by pressing the appropriate function key when the flashing question-mark (?) appears.

HARD DISK: 'Hard Disk boot' has been eliminated in favor of the booting method described in the section above.

'Slow SCSI' has been renamed 'Turbo SCSI' and works opposite previous versions. 'Turbo SCSI' is the same as the "normal" case in previous versions. Having 'Turbo SCSI' turned off is the same as selecting 'Slow SCSI' in previous versions.

The hard disk format dialog has been changed extensively. The dialog now shows a graphical display of the hard drive with each partition shown as a bar whose size is proportional to the partition size on the HD. Each bar's fill pattern corresponds to the type of the partition. You can select a partition by either clicking on the numbered box or the rectangular area corresponding to the desired partition.

The 'Type' field now shows whether a Mac partition is HFS or MFS. If the partition supports Parameter RAM saving, it will be shown with a '-P' after the type, like this: 'Spectre-P HFS' or 'Spectre-P MFS'.

'BGM' (HDX 3.0x Big GEM) partitions may now be converted to Spectre. All partitions foermatted with Spectre 3.0 will be of type 'OOP' as opposed to the old 'ACK'.

Formatting a HD partition for Spectre writes a directory slightly
different than that created by the Mac. This prevents Disk First Aid
from working. If you wish to use Disk First Aid, use the Finder's
'Erase Disk' function to create the proper directory structure.

If you wish to reformat a Spectre partition and keep it the same type
(i.e. keep an 'ACK' as an 'ACK' partition), just select 'Erase Disk' in
the Finder menus. If you wish to convert an 'ACK' to 'OOP', you will
need to use Spectre's format (after which you may use 'Erase Disk' to
be compatible with Disk First Aid).

The new Mac hard drive partitioning scheme is now recognized, so using
real Mac HDs or Mac-formatted SyQuest cartridges should no longer be a
problem. Parameter RAM saving is not supported for these drives.

After formatting a partition for Spectre use, the auto-boot setting
of the hard disk is maintained.

FLOPPY DISK: Formatting a floppy disk writes a directory slightly
different than that created by the Mac. This prevents Disk First Aid
from working. If you wish to use Disk First Aid, use the Finder's
'Erase Disk' function to create the proper directory structure.

OPTIONS: 'Help' provides on-line help (this will be detailed later).

The 'Alternate Video' option has been eliminated. The new dynamic
screen sizing automatically puts the screen in its optimal location.

Sound can be turned on and off here. 'Sound 6.0.x' has been eliminated
since the Sound Manager now works. It was also determined that due to
hardware differences, supporting the STE & TT sound hardware would not
provide any benefit.

The SLM804 device number is set here.

The 68030 options allow you to select which of the 68030's caches to
have enabled and allows you to turn Burst Mode on or off. Generally,
having them all on is the fastest, but in a few rare cases, you may run
across software which is not compatible with one or more of these modes.
Also, Burst Mode may not be supported by all 68030 boards or machines.
Turning on Burst Mode when it's not support should cause no harm, but
will not increase performance, either.

The cache options are only enabled if a 68030 CPU is installed.

The floppy cache has been removed entirely.

All hard drive access in the launcher is done in a 'Slow SCSI'-like mode to
prevent problems with some hard drives.

On the TT, if you are in a resolution other than "ST High" (640x400) or
"TT High" (1280x960), Spectre will switch into "ST High" before going into
Mac mode.

DRVR128.PRG was renamed DRVR128.SYS to prevent confusion (it is NOT a
runnable program, as its name suggested).

Spectre will look for language files, help files, keyboard files, and DRVR128.SYS in both the current directory AND in a folder called ETC if it exists. This provides for better organization of files. The SPECTRE.CNF must be in the same directory as SPECTRE.PRG.

LAUNCH.PRG will look for SPECTRE.CNF in the AUTO folder, outside the AUTO folder or in a SPECTRE folder (if it exists).

FOREIGN LANGUAGES

The Spectre launcher now determines the nationality of the TOS ROMs and will load an appropriate language file (if present) so that all of the menus, alerts, and dialogs will appear in the appropriate language. The language files are named:

USA.LNG - United States of America (this isn't really necessary)
FRG.LNG - Federal Republic of German
FRA.LNG - France
UK.LNG - United Kingdom
SPA.LNG - Spain
ITA.LNG - Italy
SWE.LNG - Sweden
SWF.LNG - Switzerland (French)
SWG.LNG - Switzerland (German)
TUR.LNG - Turkey
FIN.LNG - Finland
NOR.LNG - Norway
DEN.LNG - Denmark
SAU.LNG - Saudi Arabia
HOL.LNG - Holland

If there is a file named DEFAULT.LNG, it will override the auto-country detection. If the appropriate country's language file is not present then the built-in English text will be used.
Instructions for modifying/creating language files are in the file SAMPLE.LNG.

Note: not all of these language files are included with Spectre. If you create a language file for a country not included, we would appreciate a copy of it to distribute with Spectre.

LOADABLE KEYBOARD TABLES

Spectre will now automatically load a keyboard table for the appropriate country (similar to the language files). By editing the keyboard table, you can remap most of the keys to other keys. This is primarily for those countries that we don't currently support, although others may want to change the keyboard table as well. For example, you can now swap the

function of the Alternate and Control keys (many people have requested this). You can also create a Dvorak keyboard layout, etc.
The keyboard table files are named the same as the language files, except they have a .KEY extender (instead of .LNG). Instructions for modifying/creating keyboard tables are in the file USA.KEY.

Note: as with the language files, not all keyboard files are included with Spectre. If you create a keyboard file for a country not included, we would appreciate a copy of it to distribute with Spectre.

ON-LINE HELP

When this option is selected, a help file is loaded from disk and displayed in a dialog box. The first help "screen" is a list of available topics - clicking on one will bring you to the appropriate page. Clicking on 'Home' will take you back to the topic list page.
Help files are named the same as the language files, except they have a .HLP extender (instead of .LNG). Instructions for modifying/creating help files are in the file USA.HLP.

MISCELLANEOUS

The 'Restart' menu option in Finder now works (except on the TT).

The 'Welcome to Macintosh' and Shutdown dialogs are now centered on the screen properly. The startup disk icon and Happy Mac icons are also centered.

BUG FIXES (since Spectre 2.65/2.65c)

As stated above, the keyboard type is now correct (Mac Plus keyboard) and the problem with the Calculator DA and the keypad is fixed.

Several bugs in the in-line formatting code have been fixed making in-line formatting much more stable and reliable. Spectre should never lock up when an unformatted disk is inserted.

A bug necessitating pressing a function key twice to mount a drive after restarting has been fixed.

A problem with the Extended Parameter RAM (XPARAM) not working properly is now fixed. This was evident in the Map CDEV, which wouldn't let you set your current location correctly.

When using System 6.0.4 (and above), emulation of a Mac Plus (as opposed to Mac 512Ke) works as it should.

System 6.0.5 now works.

System 6.0.6 and 6.0.7 work, although the new Sound Manager in them does not work. You will only be able to use the 'Simple Beep'.

When restarting after a crash or failed boot, the system would often lockup (with a non-flashing question mark). This is now fixed. Under VERY extreme circumstances, this could have caused lockups at other times.

A bug in the Bus Error handler has been fixed. This now allows Grammatik Mac to work and PageMaker 4.0 to print PostScript to disk without locking up. This may also help other applications which simply freeze the machine. Note: these programs are doing an illegal Zerostore which the Bus Error handler was handling incorrectly; the real problem still lies internally to the application.

Several bugs in the serial driver have been fixed. This allows the use of Apple's Asynchronous LaserWriter driver to print directly to a PostScript printer attached to the serial port.

A change was made in the mouse handler which should prevent the mouse from ever locking up. Note that this isn't necessarily the same as the COMPUTER locking up, which is generally the result of misbehaved software.

Flashing A & B, crash page, Orwell's disk monitor and other debugger output should display properly on non-standard monitor sizes.

Pressing keypad-* at a crash page should return you to the Finder. This was always here, but never worked properly. Now, it has a good chance of working, although the crash may have left the machine in a non-recoverable state. Note that this works by "quitting" the current application and returning you to the Finder. If you are already at the Finder, this will NOT work.

Copying Mac & Spectre disks with Spectre's 'Duplicate Disk' function now works properly. Previously, there were times it would report that the destination disk is bad.

KanjiTalk 2.0 now works.

HyperCard 2.0 now works.

>What's the story with 640x400x2 ?

Duh. That means that in this mode the machine can display 640 dots
horizontally and 400 vertically with a choice of 2 different colors :^) :^)

I should have rephrased it. On the TT it is possible to change these colors
besides the BLACK and WHITE on the STe.

I was just curious if it was possible if I could have any other colors
in this mode, besides my MONO.

That would be nice.

I don't want to start a long (and boring!) discussion about this but if you are willing to pay any amount then you will always get a 'better' computer.
I've heard a braggart go on about how great his '486 machine was and how it could do anything an ST could do and some more. BUT for the price of this particular machine you could have bought 4 or 5 ST's and so more people would have some computing power on their own desks.

I really think Atari should make the business community aware of their product line and get the ST/TT into the offices of the world!

I vote for a fully compatible RAM loadable (from HD ofcourse) version for
HD owners
and if possible a stripped ROM version to satisfy floppy users and some
HD owners with little memory
By the way how big is the ROM space of the 1040STE?

>Best regards, Dr. Peter Kittel // E-Mail to \\ Only my personal opinions...>Commodore
Frankfurt, Germany \X/ {uunet|pyramid|rutgers}!cbmvax!cbmger!peterk

While I think the 2000 is a nice machine (after all, I upgraded to a 2000
from my original 1000 :-) I'm a little surprised at the "not much more
expensive" description. Over here in the UK a 2000 is 2.5 - 3 times more
expensive than a 500, and the difference would probably pay for a hard drive
and some extra memory. That's quite a lot to pay for the extra expandabilty -
It was worth it to me, since I wanted to be able to use lots of extra stuff,
and I like the seperate keyboard, built in PSU and solid case - particularly
since I'm pushed for desk space. (Every time I need to open the case to add
something new, I'm impressed by the design - Commodore did an excellent job
of making it easy to get at things! I hope the 3000 is as good..)

Anyway, back to the original point - Is the German pricing that much
different? If so, why?

And still on the subject of pricing, given that Commodore can afford to
give educational discounts to students in the US, why don't they consider
doing something for the people who've supported the Amiga so far, like
some form of discount on 3000s for existing owners?

1335. Re: tos bug Was: Using GDB

Newsgroup: comp.sys.atari.st
Date: 1991-02-08 10:55:28 UTC
From: gjh@hplb.hpl.hp.com
Message-ID: <GJH.91Feb8105528@ghiggins.hpl.hp.com>
Source record: 234946
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I had a look at my system setup following Dave's suggestion. I find that the ICD HD driver already gives me 250 folders, so it can't be that. I too suspect memory management (malloc? sbrk?). It's a bit of a pain as, under Ksh, the commandline args output whilst compiling are single, unbroken lines, so I can't tell which file it was compiling when it bombed (the filename is about 3" to the left of my screen :-( )--- but it still leaves behind an improperly-compiled (improperly written/saved?) .o file, which needs to be deleted before restarting the compilation.

The only things in the AUTO folder are COPYFIX, FSELECT, ICDTIME and MINT. There's a 60k DOS buffer, a 20K disk cache and 250 folders (from the ICD HD driver). I wonder if I need to turn on the write verification?

BTW, Eric Smith noted that -fomit-frame-pointer si inimical to -g/-gg and that he expected GCC to have mentioned this fact (RTFM, Graham -- probably). Dave Megginson says that he's had success with GDB using the unisb GCC, but that the internal gdb stuff has been stripped out and it only produces dbx info. I rmember Edgar Roeder mentioning this --- but what's the net effect? I mean what effect does that have on the functionality of GDB?

Just to satisfy my curiosity ...

Has anyone else suffered from Error 66 (invalid program load format) errors on posted stuff? The recent nroff posting (manpager) yields this error, whilst lessbin was fine. I also remember jbammi once being surprised that a preloaded TeX binary he distributed showed the same error. What I find odd is that no-one else has mentioned any problems with the manpager. Is it just my system, I wonder?

I also had to recompile flib.ttp in showdvi-1.0. Now I've seen a README endorsing showdvi-1.0 from jbammi and would have thought that he'd have mentioned any problems. Flib crashed with an "fseek" error and GCC complained about the usage of a short. I (arbitrarily) replaced the short with an int and it seems to work OK --- at least it will create libraries and showdvi can use them OK. I believe that the fseek problem might be down to the fact that the binaries were compiled with Turbo-C, but I'm curious to know whether anyone else has had the same problem.

BTW, dviatari crashes out on Jeff Long's deskjet font files (300 -> fonts), apparently seeing Character 0 more than once. Anyone got this to work successfully? I tried using single fonts but all dviatari would print was (and here I quote) "G000680c6" at the top of each page. However another dvi printer driver (dvidsk5) worked fine on those same fonts. I suspect a problem with dviatari's compilation --- anyone seen the sources of this?

Thanks for the info. Still trying.

Cheers,

Graham

There is a file PRL.TOS, stick it in your auto folder. Its purpose is to
supply all the library routines that the program requires.

Message-ID: <GJH.91Feb8113806@ghiggins.hpl.hp.com>
Source record: 234944

Well said.

One of my favourite cartoons shows two guys standing beside a new car (shown from the rear) on a garage forecourt. Obviously, salesman and prospective customer. The salesman is saying "Well, they *were* going to call it the GT-XLi-TC. but they decided to stop pussyfooting around." On the rear end of the car, there is a marque", written in that stylish chunky but slightly sloping font, "Mine's better than yours, nyahh!".

Come on guys, someone's ringing your bell.

By inference, DLII (the only defragger I've used) must use a signed short,
as I have ICD s/w driving my HD's 32Mb partitions and DLII crashes out
on them --- but works OK on floppies.

Yes, you have to run PRL.TOS before you run spice.ttp. PRL.TOS is included
in the .LZH file. Unfortunately spice.ttp/prl.tos bombs out if ataris
cachennn is resident.

1343. Elvis and Archivers

Newsgroup: comp.sys.atari.st
Date: 1991-02-08 14:50:20 UTC
From: david10@odie.cs.mun.ca
Message-ID: <1991Feb8.145020.8569@garfield.cs.mun.ca>
Source record: 234933

I've been trying to use Elvis from Gulam, but have run into a slight problem. Once I leave Elvis, all of my archivers (arc6.02, lha 1.21, zoo 2.01g) no longer function properly. (i.e. trying to list the contents of an archive may lead to a "File not found" error, even if the archive is in the same directory, or worse, corrupt the archive.) The presence (or absence) of auto-folder programs and desk accessories has no effect on the behavior.

Has anyone else experienced this? If so, is there a fix?

FYI, I'm using a 1040STfm, 1 Meg RAM, TOS 1.2.

Unless you feel this is of net interest, reply by e-mail.

Thanks in advance,
Dave C

> Have fun.
>--
>John Schmitt
>johns@maccs.dcss.mcmaster.ca
>...!unet!utai!utgpu!maccs!johns

I did this.

I printed the documentation off and then discovered that my desk is *far* too crowded for an open 9 X 12 binder, so I used Pagestream to produce pasteups for a 5.5 X 8.5 manual and cerlox-bound them: One for Sozobon C, one for dLibs. (Haven't gotten around to doing the Gemfast documentation or the floating point library yet.) It's quite nice. It cost me about $15.00 to have it copied and bound (access to a Postscript printer kept the cost down considerably).

I still have my paste-up boards around. If anyone wants a copy, let me know and I'll print some more up, as many as the demand justifies. The cost would be production and postage and probably another couple of dollars so I can justify the time. The actual dollar figure would depend on the volume.

(Aside: According to Johann Ruegg, there's a company in England which has printed the Sozobon documentation and sells it (with the compiler) for 20 pounds. I don't know anything more about it, and I got the impression that he doesn't, either.)

^^^^^^^^
I think it`s funny that you should propose this as an argument against the 68040 -- the 88000 is better than the 680x0 because Motorola backs the 88000? I think that Motorola makes lots of boards for the 680x0 as well! Also, didn't I see recently that Tektronix decided there was no future in the 88000 for them and they decided to get out? They closed down a division or something? Going by usenet alone, the 68k traffic has been higher than the 88k traffic for some time now. (P.S., I like both chips, but I doubt that the 88K will ever make the 68K go away ... and I don't think Motorola wants it to.)

Most of the 88K boards I have seen used a 68K to handle the I/O anyway; the interrupt handling destroys the advantages of pipelining and caching.

Source record: 234939
Body handling: Inline uuencoded payload not displayed: SIG.LZH

Ok now that Apple has realized the][line is dead, they are going to start pushing the Mac LC with the Apple][emulator card. What I would like to know is why Atari won't want to try the same. How much work would it take to put a 65C02 on a cadrtridge, and write the necessary software? Since GBS has figured out how to write GCR disks, with it you could run ProDOS also in the ST's drives.

With the new Mega STe, it could really be a Mac LC killer, all it has to do is take the educational world by storm. Schools will like the idea of being able to buy two Megas for the price of one LC. (The price that was being quoted in Comp.sys.apple2 was $3500 with 2 megs and a 60 meg hard drive!!)

> #machines.
>
> And the marketing people at Atari. Agreed?

Perhaps. The people I would call idiots are the ones who think one computer is inherently better than another, or that such a proposition would provable by quoting spec sheets.

For what I want to do - integrated sequencing and notation - the Atari ST & Notator does it the best for me. Having, say, a "CRAY" on my desk, even if it were small enough and cheap enough, would be pointless, since there is no software to meet my needs. Having 3,000,000 colors all on the screen at once would be equally pointless. The only multi-tasking I need is the complete integration of sequencing and notation, since I do nothing else with this computer. And yes, I have used multi-tasking - the HP 425t's with 68040's we have here at work, on which I do all other computer "work", will multitask rings around the Amiga, are faster than the TT, and have better graphics than Atari & Amiga combined. But they are useless as sequencers.

Someone else may have different needs, and another machine (perhaps a PC for data processing, or a Mac for DTP; I don't follow those markets) would address them better. That doesn't make them idiots.

>Ok How in the world [G-rated version] do you get out of here ???

Well, you're right, I *am* grinning. On one of the walls you see a sign
that says "TURN BACK". Think of all the different ways you can do that.
You can turn around and go the way you came, you can walk backwards, (looking
over your shoulder occasionally), or you go back the way you came, walking
backwards -- in addition to walking normally.

If it will help you, do the Hansel & Gretel bit again, and drop things at
every corner. The next time you round a corner, you will see that they've
disappeared -- no they haven't, you've only been transported to another room.
The "see through walls" spell might help you figure things out.

This is a very frustrating part of the dungeon, and I never did figure it
out completely. I was glad to get through it, and only used the skeleton-
key stairs from then on.

1358. Re: TT upgrades

Newsgroup: comp.sys.atari.st
Date: 1991-02-08 20:49:57 UTC
From: vsnyder@jato.jpl.nasa.gov
Message-ID: <1991Feb8.204957.10770@jato.jpl.nasa.gov>
Source record: 234947

1. Speed. I don't count how many instructions are executed per second. I haven't looked at the output of a compiler more often than twice per year since about 1970. I look at how fast a given program gets executed. At the same clock rate, the 88000 gets done twice as fast as the 68040.
2. REAL customer: A stable company with a good reputation that buys several hundred thousand or more of some particular part, e.g. 68030 or 88100, per year, year after year. By this measure, Atari is not a REAL Motorola 680x0 customer -- too small a player (several tens of thousands at most).
3. CAMMU means "Cache And Memory Management Unit", presently a separate chip.
4. I know that 200 Mhz means 5 ns clock, and that a Y-MP has a 6+ ns clock. But it also has MILES of wires. The Fujitsu VP-200 has a 2+ ns clock. The 88xxx is built on a 1+ cm die, so no wire is longer than about 2cm, about .17 ns. The Y-MP has 64 bit paths, and TERRIBLE arithmetic. The 88110 has 80 bit data paths, and IEEE arithmetic (much better than the junk Cray calls arithmetic). With SuperScalar and Multi-Pipelining, the 200 Mhz 88110 will be faster than a Cray 1-s, and at $1000 (initially) will cost al LOT less. When the price inevitably comes down to $50, who would prefer a 68090 that costs the same (give or take $5), but runs half as fast at the same clock rate? (The "half as fast at the same clock rate" part is inevitable: The 680x0 instruction set REQUIRES hazards in the pipeline that INEVITABLY slow it down, except at the expense of ENORMOUS numbers of transistors. To achieve the same speed as an 88xxx, a 68xxx will need 2-4 times as many transistors, and therefore ultimately COST A LOT MORE.)
5. My first hand calculator was an HP "Digital Slide Rule", 6 digits, add, subtract, multiply, divide. No square root. $600+. They GIVE you a better calculator now if you buy a toaster at K-mart. I don't think the price of 88xxx chips will be FOREVER greater than the price of 68xxx chips, if for no other reason than the 88xxx has fewer transistors!

Whoa!! The question was "how to get Uniterm 2.0e to send a carriage return".
The example requested was to get the character string "vax*" sent from f1.

Looking at the macro language section, the syntax is as follows:

```
send('vax*\r') # if you want the CR
send('vax*\n') # if you want the NEWLINE
```

To get it into a function key macro, the macro is %send('vax*\r'),
meaning that you must escape macro-language function calls with '%'.

Note that the string handling stuff also supports "\0xx" for an arbitrary
octal string. Since 7-bit ascii won't fit into 2 octal digits, I believe it
might be HEX and not octal - but I haven't tried anything more than '\r' and
'\n', both fo which work just fine.

>out how to play it (Guess I'm just stupid... 8^B). Can anyone
>clue me in? It looks great!

You first start out at a little bug of some sort. You first need to find some food (the little worm things) and eat it. To do this, get near it press the button and move the stick in the food direction (look at the screen when you press the button, you will see that you have to hold the joystick a certain direction to indicate you wish to eat), and keep holding it. Your bug will chase the food and eat it. You then need to find another bug like you to mate with. You will now have a "mate" direction for the joystick (with the button down). Again, get near it and hold the joystick correctly. After this, you will see the genetic selection screen, where you can play with your DNA, in hopes of becoming a higher life form (usually a doggie, or a bug with wings so you can fly). The eat/mate cycle starts again (amazingly accurate, huh?!?). The object of the game is to evolve to a person. During this whole time, you must avoid all of the other higher life forms you see milling around the gamespace. These are pretty brief instructions, if you have any more questions feel free to email.

I have the following Atari 1040 ST system forsale:

This includes the following hardware, in perfect condition:

1. ATARI 1040ST
2. ATARI COLOR MONITOR
3. NEW goldenIMAGE OPTO-MECHANICAL MOUSE (290dpi) AND MOUSE PAD
4. 2 EPYX 500XJ Joysticks

This includes the following software:

1. TDI MODULA-2 Version 3.00b (w/ registration card)
2. MEGAMAX C Version 1.1
3. Personal Pascal Version 1
4. Atari ST BASIC
5. FLASH (telecommunications software, w/ registration card)

This system is in perfect condition.
All cables and manuals are included.
The first $500 + shipping takes it all.
If you don't like my price, mail an offer.

Send me mail if you are interested.

Thanks,

I was asked by an Amiga user who accesses the c.s.amiga.* groups through a mail relay to post this here in comp.sys.atari.st. The following is the email I recieved from him.

BEGIN INCLUDED MESSAGE...
To: Greg Harp <greg@ccwf.cc.utexas.edu>
Cc: lou@vaxsc
Subject: Re: advice please - Atari-ST or Amiga
Date: Fri, 08 Feb 91 10:29:58 EST
From: lou@vaxsc

[Lou refers to my post in comp.sys.amiga.misc & comp.sys.atari.st yesterday.]

Greg, I agreed with your message regarding the Amiga vs Atari posts. I also think this guy WAY overstepped the limits of sensibility. Could you be a kind soul and post the following on comp.sys.atari.st ? I posted to comp.sys.amiga.misc via the amiga-relay and since I dont have usenet access directly, I cant post it myself. Thanx ahead!!!

-Lou (see .sig at bottom)

----------cut here----------cut here----------

From: lou@vaxsc
Newsgroups: comp.sys.amiga.misc
Subject: RE: Atari vs. Amiga Flamefests ... (was Atari vs Amiga, Advise Please)
Message-Id: <44017@nigel.ee.udel.edu>
Date: 7 Feb 91 15:59:24 GMT
To: amiga-relay@udel.edu
Sender: amiga-relay-request@udel.edu

I realize this should probably be posted over in comp.sys.advocacy but ... sorry for the waste of space.

Have you ever noticed how the Amiga vs. Atari wars usually end up with both sides saying the same things? For example,

"The Amiga does multitasking better than Atari ..." (example only!)
"The Atari does Audio / DTP better than Amiga ..." (example only!)

etc. You get the idea. The above lines are NOT open for debate!
They are presented only as examples of such lines used in flamefests.

So, why is this? I have a clue that both sides are rathar insecure about their purchase, and I suspect that the culprit is neither Atari nor Commodore, but the multitudes of IBM/PC and MAC owners out there. How many times can you Amiga AND Atari owners count that PC owners have attempted to trash your machine? You may know the machine is

better, and you may have even convinced a few others of this fact, but in general, how many times have you been left feeling as the butt end of the purchase, primarily because the masses disagree with your point of view, and instead of them attempting to recognize you, and ACCEPT you, they contend that "they're better than you".

Further, doesn't it ring especially true when you want to go and buy a software or hardware item for either the Amiga or the Atari? You find acres of store space devoted to PC's and MAC's but nothing (or next to nothing) for the Amiga or the Atari? Ok so some of you in the VERY large metropolitan areas (i.e. LA, New York, Chicago, London) may have dealers close by. Great! I'm happy for you. But there are others of us who live in metropolitan areas, albeit smaller ones, who are STILL forced to use mail order because of a lack of stores which carry supplies/software/hardware relating to either the Amiga or the Atari!

Finally, I have only seen one post which brought out the truth of the matter before. Flamefests typically generate large arguments with very little point to them, and this one seems to be no exception. But the truth still remains. The original question, for what purpose did you buy YOUR computer, and does it STILL serve that purpose must be asked. Hopefully, it will be asked before you recommend or flame another machine. I see posts asking for advice continually on which machine should I buy, and why, but I rarely ever see the most important question in the reply. That question being, "What do you intend to use the machine for?"

Further, manufacturers are not guiltless in this campaign. They have different motives, motives which usually do not take into consideration that it is PEOPLE that use their machines. IBM and APPLE are famous for obsoleting their hardware as soon as you've purchased it. But they are not alone, and this attitude in the personal computer industry is prevalent. This further aggravates the buyer into a position of doubt about his/her purchase.

So now that I've opened myself up to yet another flamefest from the PC/MAC users out there, allow me to squelch it now. I am NOT attempting to say that they ALONE are responsible for these attitudes. There seems to be a general consensus in the personal computer industry that the following things are important:

1. If my machine is better than yours, you should own the same thing as I do.

2. If my machine can do more than yours, then your machine should be driven out of existance.

3. My machine is so great that I can withstand any amount of upgrading, because it will only make a great machine better.

Beginning to sound like a materialistic society yet?

Remember, these are PEOPLE who use these machines, not the other
way around. Before you flame somebody because their machine is
different, go look at yourself in the mirror and ask yourself,
"Is there something about me that could be better?" Specifically
"Why should I make them feel poorly about their purchase, simply
because it's different? Perhaps they have different needs than I.
Further, would I want them to make fun of my purchase?"

I, for one, have had just about enough of the materialistic values
of most personal computer owners out there, and worse yet, the spread
of these values (or lack thereof).

Just my $0.02 worth. Please send flames to /dev/null
Please send followups to .advocacy (of whatever group/machine you
choose).

I don't have a number for you, but, holy cow, what an ordeal to find those little buggers!

Shreve Systems has the license, the right to sell them, at least the supply they have, at a very good price of $265. If you buy them from these guys you can be assured the FBI won't knocking at your door the next day.

I bought the last of two sets a week ago. Anywhere else may sell them lower but I wouldn't give them my money cause they probably don't have them. (AND they won't be getting any either!)

Oh yeah, one place is selling them for $500 can you believe it?

This could be the END of Mr. Small's company. He is going to have to shift his market niche otherwise he ain't going to make it. (ie SST BOARD).

Apple is on a vengance hunt for all those people who bought those bogus Denis Hayes ROMS..mostly ST users. Therefore, NO MORE ROMS.

Source record: 234758
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

In article 4fb2916e.20b6d, Walt Weber points out how I may have given incorrect advice for programming Uniterm to send the string "vax*" followed by a carriage return when the F1 key was pressed. He then presents an example of how to use macros within function key definitions to achieve the desired effect. However, my solution does work and is simplier if all you want to do is send the string "vax*" followed by a carriage return. There is no need to imbed the string in a macro. Now if you need some real smarts in the characters sent, then a macro is essential.

Terry

I just went out and bought "Falcon" by Spectrum Holobytes.
I CANNOT recommend this program. Not only is it copy protected,
it is "double protected." The disk cannot be backed up by
normal means and furthermore they also have a codewheel.

All in all, this is a most unsatisfactory program package.
It is not a company who I would like to see succeeding in
this industry. Hopefully, someday I'll see the founders of
the company bankrupt. I will feel no regrets about that at
all.

Those of you planning products in the future, for the
Atari or any other computer, read this message twice and think
about it.

Who was the geeeeen that stated that there were only a few Amigas in Germany, while the ST is rampant. I lived in Germany (Bonn) up until last year, and even then there was a VERY BIG Amiga scene. Far bigger than in the states. Amiga is actually able to compete with IBM in MANY of the European countries. The ST and Amiga have very similar presence in Germany. And since I've left, the ST market share has dropped considerably.

Also, if we talk about other countries I visited in the area:

France: Lot's o Amigas.
Denmark: Lots o' Amigas.
Sweden: Very lots o' Amigas.

I would have to say that in these 3 countries, the ST was far outnumbered. I went to big "pirate parties" in France, one of which was busted by the "French Software Police." It was a gas. The ST has groups with similar parties, but the piracy is much HIGHER among the ST community. This comes from 3 different dealers in Germany, and 1 in Denmark, all of which have had to compete with outfits that SELL pirated software over the counter. Like B.Dalton's Software Etc.... But the laws are a changing. One of my friends from Germany just informed me a few months ago that Germany now has Software Laws as well. The people were upset that it also restricted people copying in a party-like way, not just the selling. Amazingly different attitude over there...

(stuff deleted)
#evnt_button(from memory) lets you specify three parameters:
# - ev_bclicks, the number of clicks to fire on;
# - ev_bmask, the mouse button mask (see below)
# - ev_breturn, the return button mask (see below).
#
#The mouse mask determines the mouse keys to check: it is a coniunctive
#bit mask, that is, bit 1 = left button, bit 2 = right button.
#Example: 0 queries for NO mouse buttons
# 1 queries for LEFT mouse button;
# 2 queries for RIGHT mouse button;
# 3 queries for BOTH mouse buttons.
#
#The return mask is much the same, only this should be considered a template
#for the events to accept.
#Example: 0 accepts NO mouse buttons pressed;
# 1 accepts LEFT button pressed;
# 2 accepts RIGHT button pressed;
# 3 accepts BOTH buttons pressed.
#
#So if you want to wait until the user presses the right mouse button, you
#specify 1 click, button mask 2 and return mask 2.
#
#By the way, as you may have noticed you cannot inquire 'left OR right mouse
#button', only none, one of both or both together.
#But there is an undocumented way of doing this: (I got this from Claus Brod):
#add 256 to the desired value of mouse clicks, and the button and return masks
#are viewed as negated.
#So evnt_button(257,3,0,xptr,yptr,bptr,kptr) is interpreted as 'NOT (the left
# and the mouse button both released)', that is, 'left or right button
# pressed'.
Jeroen asked me to add in this summarize the 'xptr,yptr,bptr,kptr' values.
So, and as far as I know:
- xptr points to an int that holds the 'X' coordinate of the mouse pointer
- yptr: the same but for the 'Y' coordinate
- bptr points to an int that indicates the button state when the event occurs
- kptr points to an int that indicates the state of the Ctrl, Alt, Shift keys
all ORed , in the following way:
- 0x0 : all keys up
```

```
- 0x1 : right shift key down
- 0x2 : left " " "
- 0x4 : ctrl key down
- 0x8 : alt key down
#
#By the way, I seem to recall return value of 0 is quite normal for the function:
#you get the return values from the pointers you supply.
#(That's the way it is in evnt_multi anyway...)
#
#If you still have any problem, why not mail me the fragment of the source
#containing the problem? I'll look at it and (hopefully) can help you.
#
#Greetings, J. (jeroen@phil.ruu.nl)
```

It's OK for me now, Jeroen.

Notice that the MWC manual doesn't say that ev_bmask and ev_breturn
are 'bit weighted'...

Hope this helps other MWC owners.

Regards and thanks at all the replyers.

>effect does that have on the functionality of GDB?
>

I've had success with gdb, but it's been very mixed. When I try it on large programs, there is not enough stack space for the symbol table (yes, it uses alloca, I guess), and on medium-sized programs, it often loses synch with the source code. Oh well, ... for now, I just bring my source to a Sparcstation, recompile it there, then use gdb to find the error--it's faster than wasting my time on the ST trying to do it.

It would be __great__ if someone could port szadb to gcc, so that it could read the gcc symbol tables. Since gcc can leave local as well as global symbols in, it would be pretty useful.

So, if it is true that Apple no longer allows the sale of Mac ROMs, is the Spectre GCR dead? Or are we about to see a sudden boom in pirated ROMs? I gather that the Spectre has to be modified a little to accept EPROMs, but it's a minor mod at most....

David Paschall-Zimbel writes:
>>I, personally, find such a concept disgusting. It promotes a bigotted
>>racial stereotype of Arabs. It's on the same level as video games
>>such as the infamous 'Custer's Last Stand', where the objective was to
>>rape as many Indian women as possible.

Although I agree with David that this 'game' file is objectionable because it promotes racial bigotry, I don't think he is advocating censoring the file. It appears to me that he's trying point out how such a file can be offensive to some people in much the same manner as the 'Custer's Last Stand' file is.

Glorifying violence against an 'undefinable man riding a camel' can be seen by some as lumping all Arabs into a group that should be shot at. Some people in the USA are acting this way, as can be shown by the violence being perpetrating against non-Iragi Arabs during this very stressful time. And yet, Americans are losing their lives in an effort to save the lives of Arabs from Saudi Arabia and Kuwait. That's the only reason can I see why we're fighting. By promoting and distributing such a 'game', race hatred might continue. This is what David is objecting to. Thanks for being sensitive, David.

I hope that most people will realize this and ignore the file.

Jeff Weiner writes:
>I respect your opinion David, and encourage others to voice theirs in the
>appropriate arenas. However, the file will stay in the archive.
>I would view anything else as blatent censorship, and I will have no part
>of that whatsoever.

I appreciate this, Jeff, as your position is to allow access to all Atari software, not to choose what to limit. The person doing the uploading can censor what they upload, just as a book publisher can censor what it publishes. We do it now because what is available on the archive now is far less than the total available Atari software.

Jeff, is there a limit to the amount of space available for the Atari archive? It seems that at sometime we will have to choose what is stored there. Will we have to someday 'censor' what is kept at the archive in the name of 'disk space'?

-Bob

P.S. Yes, I know, there are appropriate groups for political discussions, and this isn't one of them.

I think that perhaps you have bought an old copy. I have Falcon and
both Mission disks, none of which have disk-based protection. In fact,
the newer ones can even be installed on hard disks (speeds up things a
lot). However, I will agree that the code wheel is a pain; it's often
very hard to identify what icons are on the screen.

He is absolutely right!!!
And a simple request: ST/TT-users (I am one of them), stay out of the
Amiga-groups, if you can't follow them peacefully.
To followup in Amiga-group, you should know about
Amiga and forget ST for a moment.

Amiga-users, stay out of Atari-groups, if ... (look above)

Users of both, or persons that own either but use both occasionally,
please do not compare these machines here, unless you can do that
with the great professional touch of a true neutral-minded journa-
list. I use both Atari and Amiga almost every day, but I have seen
that this is almost impossible.

And those flamy letters I have received. It is no use to abuse ST or praise
Amiga to me privately. As soon as I find out that the letter is like that,
I simply quit reading it and press D(elete)...
Those of you who have got replies from me (Amiga-users specially), read them
through carefully, you may learn some strange things that you wouldn have
beleaved about me.

Nowadays I keep a fire-extinguisher near when I read these groups...

> I find one?

You like to go quite deep? ST is quite a plug-and-play machine, you
don't need to tell much to it to get peripherals work. But
there are books that scan deep inside ST. They are a bit hard to find
nowadays. In UK and Germany they are well available.

>I have an ATARI 520ST with 500K ram (s/n# A11003969 - does that mean
> anything to anyone???). What are my options for upgrading?

That can be a base for anything. I started out with a regular 1040STF.
Now I have a 16MHz 4Mb RAM 170Mb harddisk bigscreen monster living in
a tower-housing. The old motherboard is still there! That is possibly
with every ST. Best expansions are avilable in Germany, except RAM.
To upgrade RAM, from UK you can find definitely the best expansions.

I live in Finland, and still I export almost everything form my ST
from Germany, UK and USA.

>I have a printer that will not operate with the CENTRONICS cable (the
> same printer/cable operate fine when attached to "one of those
> other PC's"). How does the ST know if there is a serial or
> a parallel printer attached? What is the correct cable
> configuration to use?

The cable I used (before I bought a laser) was a simple direct centronics.
With ST the printer should be able to emulate epson. There is a desk-accessory
where you can set printer's port and other stuff, but I never used it bacause
all programs printed nicely without any extra settings. Centronics is a
default for printer in ST.

>What are my options for a hard drive? What type of HD am I looking
> for? I now have two floppies - SS354's.

Get yourself a SF314 or other 2S-drive fast! You will definitely need one.
There are hard drives specially made for ST, the megafile-serie, but a
very good alternative is a DMA-SCSI -interface (ICD, Supra, etc.) and a
SCSI-harddisk (Quantum, Seagate, Conner, Maxtor). I have myself a ICD SCSI

interface with two Seagate ST296N 85Mb harddisks. Works fine. With megafile
there are only 2 good, the 60Mb model and the removable 44Mb. Smaller than
40Mb are likely to get filled up too quickly...

>Is there a translation capability to read/write IBM & MAC 3" discs?

ST reads directly IBM's 3.5" DD disks. With discovery-cartridge or Spectre GCR
Mac-emulator you can access Mac-disks. By the way, Spectre is worth trying!
Faster than Mac + and bigger screen. Copatibility is very high!

>Are either of the monitors compatable with other PC's? I have a SM124
> and a SC1224 as well. (e.g. I don't need two monitors,
> simultaneously - could the one I'm not using be hooked as a
> display for something else?)

Both MONITORS are, but their connectors ARE NOT! I use multisync instead
of two separate monitors...

!>Must I dismantle the unit to read the PROM version? Is there a way to
> ask it? ...and what is the current version of the OS? If I don't
> have the current version, how can I get it?

No, you can't see the version directly from anywhere. But if there are
more than one year mentioned in the copyright-line of the TOS-box, first
drop-down on desktop, about ... , the TOS is newer that 1.0.
Latest is 1.4, you can get it from almost any Atari-dealer.

> I cannot find an LHARC program for UNIX
> [I want to] see what it is I am downloading
> before I download it ...

There must be at least two versions...

(1) There is the version done by Bill Shroka. He prepared
compatible versions for the Atari and for Unix. His address is

uunet!hal.cwru.edu!ncoast!bjsjr

My understanding is that he did this with the support of J. Bammi
while he (Bammi) was still at CWRU.

(2) The software support folks at the Univ of Waterloo seem to have
found one somewhere. Maybe there is a unix sources group to look at.

(3) Howard Chu announced recently that he is working on a version
of lharc. I guess this means that he also has source. Whether or not
it is taylored to unix is another question.

My biggest complaint right now is that there are several slightly
incompatible versions of LHARC. I would like to see a shakeout
so that I would not have to keep several different versions around.

Someone asked about de-fragmentation. If you keep an empty partition,
you can do it at your desktop. No fuss about 512 or 2048, short, signed
short, long, unsigned, etc. Just drag your stuff to another partition.
Clear the partition. Drag back.

For a floppy, I recommend using a ramdisk as big as
the floppy, and copy to a new disk.

1401. Atarti ST1040+hardisk System for sale

>A3000.

I don't have A3000 or Minix either. I have used Atari under TRUE WORKING
FULLGROWN UNIX-OS! It was made in Germany. That ST had four terminal programs
running simultaneously, downloading while previously downloaded files were
extracted simultaneously. All processes visible in X-Win type g-environment.

> Once again, bullcrap. I can buy an A500 for $499 that outclasses the

>their computer. Mac has system 7/multifinder, 386/486 has OS/2 and Windows
>and Unix. The Amiga has what it had since 1985.

I don't get it. Is multitasking some kind of religion to you? You don't
propably even buy a pen, unless it multitasks...
I have often found multitasking (specially in Unix) more confusing than useful.
Human beings can not concentrate to more than one task at a time.
Buy If I want to multitask, I'll do it. I have a true multitasking OS for
my ST. One of my Amiga-using friens said that it is better than Amiga's.
Again something made in Germany. Hope those never get there, because there
are so many people like you, who are too biassed to understand anything
strange and new.

> Seriously. The Atari's niche is MIDI. You don't need fast CPUs for

>personally, I am hooked on multitasking and can't do without it. Also
>since I work with Unix, the fact that AmigaDOS is simular to Unix
>makes it attractive.

Good enough MIDI-software needs fast CPUs. I am about to go for 33MHz.
You are the first Amiga-user that is proven to be a multitasking-maniac.
I know about 60 Amiga-users, 10 of them are my good friends...
They either have nothing agaist ST, some of them even use one frequently.
My opinion is that Amiga is a master of graphics and soud, but it is not
very handy in word-processing, DTP or things like that. OPINION!

> What are you, a Marketroid? You are welcome to live in your
>own little dream world, but IBMs are still the hottest computers
>with a SOLID market.

Intel's unhealthy marketing policy will take IBM & clones with it sooner
or later. I have no dream world, I live in the real world but with your
attitude to other people you should close yourself to your own world...

I prefer rational discussion to flaming...

But let's drop this shit. Peace is far more comfortable. We have thrown enough flames to each other's face now. Let's stop before it is too late.

BTW, PCs are the most unuserfriendly machines I have seen. I think Mac is something special. But if you really want something cool, get NeXT or Sun SPARCstation. Those are far more superior than any of these Atari- and Commodore-toys discussed here... ***OPINION AGAIN!!!***

- Get yourself a SF314 or other 2S-drive fast! You will definitely
- need one.

Well, it's not that much of a necessity. When I got my 1040, I didn't buy a second floppy because I had planned (or hoped :^) to get a hard drive. I didn't see the real need for two disk drives if you had a hard drive. Even when copying disks, the computer reads the data into memory and then spits it out to the other disk; it doesn't read and write simulaneously unless you have something like the Blitz cable. Not unless you do A LOT of copying of disks, can I, in my opinion of course, see the need of a second drive.

Hello Jartsu,

the other way round... Spectre works on supporting overscan. The older
overscan was not supported by spectre. But there is realy a good chance that
future versions of spectre will support the new overscan. First we now
have english docs and second, we sent a overscan package directly to
Dave Small :-)

Greetings, Karsten ki@opal.cs.tu-berlin.de <OverScan GbR,Berlin>

Somebody asked the question:

Why would Atari insist on selling you the hard drive THEY want to sell?

Here are my thoughts:

o perhaps because they can sell it pre-loaded with software. How else would distribute all of the O/S, floppies, seems a bit inconvenient

o How would they do quality control on a diskless system? Seems to me that selling half-built systems introduces a lot of complications. Hard disks and hard disk drivers are not that stable yet despite the general acceptance of SCSI. There are still compatibility problems with some drives. Seems to me that selling a system with a harddisk installed is the simplest route to go. Keep in mind that the vast majority of people out there are not hardware hackers.

- My biggest complaint right now is that there are several slightly
- incompatible versions of LHARC. I would like to see a shakeout
- so that I would not have to keep several different versions around.

I don't understand the problem. I use DC Xtract 2.0 from Double Click and it extracts everything. Before I had that, I used UNLZH 1.72 and that extracts everything. To compress, I use DC Xtract and I used LHARC 0.60 before that. I don't understand why people must have different versions to extract. I go through as much compressed software as the next guy -- if not more since I'm a sysop -- and I only use one version.

If you're referring to the Unix version, then I guess that's a different story, since I don't use it much.

HERE is a relative term. You mean inside your neighborhood? I'm curious
, what 'official investigations' are these? I'm more inclined to believe
the ST is used more for games? Why? Because I know some ST pirates
personally, and the pirating scene is humongous! Also because the
ST is sold in Europe with 'game packages' and it hooks right up to a
TV with no monitor. The Amiga is rather expensive for a games system,
since you usually need around 1mb of ram, a monitor, and a second
disk drive. This comes to about $700-800. When Segas(Megadrives), Nitendos,
and Turbografix(not to mention STs) are far cheaper, they look better
for the gamer.

This must be a 'hacked' up port. I'm not aware of an official
Atari AT&T Unix port yet. (Unix has to be licensed, it costs lots of $$$
for the source). Besides, the Amiga can do everything you mentioned above.

(i've downloaded and extracted simulatenously, vied GIF pics, formatted
disks, etc)

Well, that can be debated. Multitasking doesn't mean concentrating
on more than 1 task at a time. It means that you can put other tasks
in the background, and split off sub tasks to do important things
you want.
For instance, on my Unix here, I can hit CTRL-Z, stop rn, type
'make' and put a compile in the background, then type 'fg' and resume
rn while something is compiling.
Multitasking isn't a religion, its a luxury. Everytime I download
something to my Amiga, I can extract it and runit while my terminal is
still loaded and connected (and downloading).

I guess I can call you a 'MIDI' or 'DTP' maniac then? Just because
I like multitasking doesn't mean I'm fantic about it. For me, its 'normal'
I usually don't notice I'm multitasking, or realize how nice it is until
I have to use an IBM/DOS or Mac.

>1. Speed. I don't count how many instructions are executed per second. I
...
> the same clock rate, the 88000 gets done twice as fast as the 68040.

Running what software? Not existing ST software. To run ST software without modification requires that the 88000 system be able emulate 680x0 instructions, or that all of the developers port their software to it (a dubious proposition 8-P). Assuming an emulator was written, you'd need to crank much more than twice the dhrystones to keep up with the 040.

For present 68000 machine owners, the 68040 is not an "obsolete" upgrade path in terms of speed. It will run their existing software much faster than any processor that will fit in their case (see, this excludes the Cray :)).

What software did you have in mind?

>2. REAL customer: A stable company with a good reputation that buys several
...
You don't need real customers if you have real volume; the kind of volume intel gets from the jillion little clone companies buying 80286's. As long as the new 486 runs DOS programs, intel doesn't need one real customer to make money off of it. The same could be true of Motorola, if Mac clones (for example) became ubiquitous. As evidence of this, the success of Sun's SPARC technology is due in large part to the fact that Sun didn't keep it proprietary, actually encouraging third parties to produce it, assuring a large installed base, assuring a future demand for new and improved Sun workstations and software.

>3. CAMMU means "Cache And Memory Management Unit", presently a separate chip.

This seems a good way to design a fast system, even a system that is easy to implement into a final product, but it is not the way to make an economical personal computer, where you try to reduce the chip count as much as possible. Instead of buying one chip, you have to buy three. This is likely to cost more than buying one chip. See item 4 (PRICE?) below.

>4. I know that 200 Mhz means 5 ns clock, and that a Y-MP has a 6+ ns clock.
...
> a 68xxx will need 2-4 times as many transistors, and therefore ultimately
> COST A LOT MORE.)

As someone mentioned, the price of a memory system to support a 200MHz clock is prohibitive. A cheap processor with an expensive memory system and many expensive memory chips costs more than one expensive processor

and a simple memory system and many cheap memory chips.

Notice that the 68040 includes an FP and cache on-chip. That effectively
reduces chip count and final system cost, if you were going to include
the FP and cache anyway. If you weren't, you might be interested in the
fact that Motorola plans to release a low cost version of the 68040 this year
...I think it's called the 68EC040. No FP, smaller cache, fewer transistors:
lower price. Just what the doctor ordered for upgrade boards.

Of course, right now it's just as available as the 200MHz 88K :-).

...
> I don't think the
> price of 88xxx chips will be FOREVER greater than the price of 68xxx
> chips, if for no other reason than the 88xxx has fewer transistors!

Another way to look at it is that they will forever cost about the same and
the 68xxx will be slower. But that does not mean people will deem it
obsolete in terms of their own needs.

For most people's personal needs, a 68030 is not just adequate, it's
ideal. Unlike the 68000, it has an on-chip cache (256 words of data,
256 words of instructions), so that even if it's driven up to 33MHz
and used with slow (cheap) memory chips, it may not necessarily need
a large external cache to give a reasonable speed improvement over
16 or 25MHz versions. Furthermore, a 16MHz 68030 is dirt cheap NOW.
And if you could get a 50MHz 68030 at a similar price, you could have
your cake and eat it too.

For reference, my definition of 'obsolete':

A product is obsolete if there is something better which can be used
for the same purpose.

That's why I think that if people can't use the alternative because it
costs more than they are willing to pay, or if it isn't fit for the
same purpose, then the original product is not obsolete.

*********

From the Editors Cage:
```

Welcome to Huh newsletter. A lot has occurred in my life recently which in turn brought my desire to start this newsletter. I recently purchased an atari Stacy computer thus entering the Crazy world of being an Atari owner.I never thought much of Atari computers which is why most people do not look our way when it comes to purchasing a computer. No one seems to know what an Atari ST computer is or what it can do. Most people thought it was over for atari except for games when Warner Communications sold it to Jack Tarmiel. Alas, there is much to crave in this dizzining world of computers. That is why I wanted this newsletter to exist- so that the Atari users can have a forum in which to ask questions, and read reviews in laymen terms. All publications I have seen attempt this, but start talking about wiring diagrams, etc. We will attempt to break it down further. Since user groups are not near everyone, I wish to provide information to all. Hoping all sysops pass this around as much as possible until we can find a way to network this to all Atari BBSs out there. In the meanwhile we will have small reviews and comments until we can get more user input. Everyone is invited to write. Send email through internet, and to pick up the newsletter call these excellent BBSs:
Solano Station 707-446-4158 Odyssey bbs 707-437-4734
Also I am compiling user addresses and names, and Atari BBSs numbers to start a database of users to provide vendors of products big and small a possible customer list and to show our force in numbers. Maybe in the future we can send out this letter to non modem users.The newsletter will be out the 1st of the month and around the 15th(depending on the help I get?). Look for it in the above BBSs. Now sit back and enjoy the beginning of something nice.
****

Atari news:by Chuck Schul
Atari Releases new config.for Atari STE in Canada, 1 meg no hd. At the November Comdex New full config Mega STE was shown running at 16 mhz with a 50 mb hd
Atari Stacy to get retooled for a better fcc class rateing.

St Informer raises price of there mag subscription to $19.95.They are sending it 2nd class mail now vs 3rd.

Dreampark development 1.44 drive released.Internal upgrade for our ds drive for $139.95 or a new unit with own case and power for $219.95.Also a drive small type for stacy "lapmate" out 720k ds drive.

8 bit cave:No Writer yet help help.Nothing new commercially is all we know.

ST hovel:by Chuck Schul

well welcome to this section of the newsletter.Most people by reading this far are either turned off or just have nothing else to do.Hey I know it is bad but I am trying how about you all.I for one am very happy with this computer.I really cannot understand why anybody whould shell out monmey for an IBM Clone.No sound(unless you get a sound card),type type type all those nice(ha)commands in.I guess people like to punish themselves or feel that they are in the mainstream.A mac is a different story they are ok except the cheap ones with no color monitor or high priced color systems(yukie).And the Amiga(i think it means friend in some language?)is similar to or machines except for there operating system workbench.I think workbench is real bad to use but you got to see it to believe it.All the magazines and Atari newsletters I see always complaining about Atari Corp.They may be bad but we got to help push our machines to the mainstream.So I think people should join the atari revolution,Artisan Software publishes a book of activities to spread our machine through the media and other ways.Write to them at the following for the book with a check for $14.95 to:

Artisan Software

po box 849

Manteca Ca 95336

Well Inconclusion I would like to say welcome again and I hope to hear from all of you in one way or another.An please also support our warriors in the gulf and god bless America!!!!!

Views and Reviews:

Public Domain pick of the month:

Saddam shoot- by Weirdsoft a fun shoot em up game where you shoot the mad man and gets some impressive results. For the locals here it's on Solano STation BBS.

Union Demo 1:

One of the greatest graphix and souns demos ever.move a animated figure to different rooms and see different stuff.blows your mind.I saw a sequal to it and it was even better I hope to find the person or anyone with it please let me know.If any one would want a copy of it I plan to upload it to the above mentioned boards.

Atari 8 bit pd/commercial/hardware houses:

L and Y Electronics B and C computer visions

13644 C Jefferson Davis Hwy 3257 Kifer Rd.

Woodbridge,Virginia 22191 Santa Clara Ca 95051

703-494-3444 1-800-969-8810

America Techna Vision Alpha Systems

2098 Pike Ave 1012 Skyland Drive

San Leandro Ca 94577 Macedonia Ohio 44056

1-800-551-9995 216-374-7469

I plan to update you with addresses quarterly. If you know of other addresses for 8 bit support email them to me through the boards or internet. Until then that's all I know of.

Atari 16 bit pd/commercial/hardware houses:

Below are some of the places I have used for ST support,if you know of any others please email them to me and I will update it like the 8 bit section.

Computer Safari D and P Computer

606 W.Cross St. po box 811

Woodland Ca 95695 Elyria Ohio 44036

916-666-1813 800-535-4290

Sideline Software Rising Star

840 N.W 57th court po box 20038

Ft Lauderdale Fl 33309 Dayton Ohio 45420

800-888-9273 800-252-2787

All dealer and software houses are welcome to join the list.

Atari BBS list:

Solano Station BBS 707-446-4158 Supporting Atari's, MAC, Ibm Computers.

Odyssey BBS 707-437-4734 Supporting all types of computers also net mail.

Starlink BBS 707-437-3468 Supporting all types of computers.Online Games.

Those are the only local BBS's i know of that support Atari,I will update every 2 weeks. All sysops that support Atari files are welcome to Join our list and carry the newsletter. Send email to the above bbs's to Chuck Schul,except Odyssey email to chuckie.

Dead zone:

This is our special section to list commercial software releases to the public domain.

Aegis Animator

That's all i know of. If any of you know of any other email the title with the company's phone number so we can verify and list it.

Kitty corner:

Our section on the Atari Lynx.We will list games available and upcoming releases here.

Available Games:

Electro cop, Zalor mercanary, Klax, Slimeworld, Paper Boy, Blue Lighting, Upshot, Xhenophobe, Chips Challenge, Gaulent, Road Blasters, Rygar, Rampage, Ms Pac Man.

Coming soon- Fly World, War birds, Shanghi, Ninja Gaiden, A.P.B, Vindicators.

We will attempt to review all new games in a future issue. If you feel we should do the current onesa also let us know.

Top picks of games:

1-Powerdome-Cool Grand prix racing games set in the future graphix will blow you somewhere deep.My body tingles when I think of it ohhhhh.

2-Targhan-Another conan game but with a nicer style.Nice backdrop graphixs.With a good adventure that makes the slashing more fun!

3-Populous-Assume the role of a god and form your side of the planet and watch out for the bad dude(i call him satan).PLay against the computer or with a bud via modem.Hours lost on this for me I love it!!!

Thank God it's over:

Well We are done with Issue one!Hopefully with some help in 2-4 weeks issue two with some support from you all.Send in your articles and reviews for a look see.I can't do this alone.Till next month take care guys!

****

If you have any suggestions for other areas email them to us and let us know of any special sections you want to do. Email them; we can work something out.

Until next issue hoping you don't die by then the Huh Staff.

> Thanks in advance, michael
>(doser@cernvm on bitnet, vxcrna::doser on decnet)

The situation with Mac ROMs is getting wery bad. They are almost impossible
to get from US. I know a firm in Germany, called Fearn & Music. They may
have those for sale separately also, as they advertise Spectre GCR with ROMs
for something about 1000,- DM. I don't have their number or address handy
now, but it should be easy to find from almost any German computer-oriented
magazine, at least STmagazin.

>opinion of course, see the need of a second drive.
>

Let me make a little correction. That someone who asked the original question said that he has two SF354 drives. They are both SINGLE-SIDED! I recommended he to get a double-sided drive instead!
I have never really needed a second drive either, but I definitely need my drive to be double-sided one. Now I have two of them, the drive A being a HD-one. And that is simply because of Spectre. I also have a big 170Mb harddisk, so one drive would well be enough.

>I vote for a fully compatible RAM loadable (from HD ofcourse) version for
>HD owners and if possible a stripped ROM version to satisfy floppy users and
>some HD owners with little memory

Well there's another vote! Are you reading this Atari? Perhaps we should
petition Atari about this.

>By the way how big is the ROM space of the 1040STE?

I think this is the situation on ROM size and location:-

Machine	Size	Address	TOS Version
ST,STF,STFM	192K	$FC0000	TOS 1.0,1.2,1.4
STE	256K	$E00000	TOS 1.60,1.62
Mega STE	512K	$E00000 (?)	TOS 2.05
TT	512K	$E00000	TOS 3.00 (?)

Note however you should *NEVER* rely on the address. You should get the
address system header at $4F2 and work from that.
I guess the STE could be hacked to take 512K of addressing. Maybe the MMU
craps on that idea.

1417. Re: Forwarded post dealing w/Atari vs Amiga conflict

Newsgroup: comp.sys.atari.st
Date: 1991-02-10 16:26:48 UTC
From: s37837k@saha.hut.fi
Message-ID: <1991Feb10.162648.18115@santra.uucp>
Source record: 234617
Cross-posted to: comp.sys.atari.st,comp.sys.amiga.advocacy

Now I think it is a time for refreshed ideas and thoughts.

Instead of fighting agains one another, dear Amiga and Atari users,
we should unite, put our tremendous forces together and start making
our machines known in the world of business, or as you all well know,
in the world of Macs and PCs.

This insane flamewar proves that both Atari- and Amiga-users *love*
their machines, so this would be the best thing to do.
War between Atari and Amiga is like the fight between protestants and
catholics, only different sideways of a strong main-route.

Here in Finland there already exist small groups having both Amiga and ST-
users as members. Lots of different propaganda is produced to fight agaist the
evergroving power of PCs & Macs. But this is done only by the power of pen &
typewriter & word-processor, sometimes with a speech also. We teach things
about different computers to young, first-time users, so they could wisely
select their computer. We are not brain-washing them!!! Many of us are
also PC- and Mac-users. I am typing this article in with a PC.

So, if this idea is good, or anyway, followups are welcome!
It works here, why won't it work everywhere?

I know this may not be the base for this (our host only supports comp.sys.atari.st, as far as atari stuff goes), but does anyone out there own MIDItrack III for the Atari 8-bit. I have been looking for it for some time now. I don't currently have the money to spend on an STe (which I desperately want), but I want to sequence my Yamaha PSS-680. If not MIDItrack, then I might consider another package as well.
By the way....Is there an Atari 8-bit base in existance??

Don't you have anything better to do besides post worthless messages? If you have a problem with specific users, mail them!

BTW: Heheh. Apple IS fun to bug however... :-)

> WHat is it with you morons? Are you so bloody insecure or what? You
> want to fight, I'll kick your fuckin' little brains all over the
> floor.

Bloody insecure? No. Just tired of seeing arrogance on both sides that "My computer is superior to yours". I've been part of month-long arguments (not on Usenet, thank God) about whether the ST or Amiga is better. The result? It's IMPOSSIBLE to convince anyone who's spent a good $1000 or more on a system that their computer is inferior to another.

Physical violence? And how, pray-tell, are you going to find all these people to kick their little brains all over the floor? Are you about 6? Any argument/complaint you have goes to pot when you start threatening physical violence. Especially when it's impossible for you to fulfill your threats.

> Am I pissed? Damn right. And I am not the only one.

I can understand why. But, as I said before, reply via Email, and don't threaten physical violence. It makes your apparent maturity level go to 0.

> Say what you will, you shits, stay on your own fucking side.

Same goes for you.

>
>Join the club! It looks like great fun but the only thing I've managed to do

I don't know about wheter ECOLOGY.LZH is only a demo or not, but if it's
the "real thing" things are easy enough: First, you have to make sure
you don't die of starvation. Second, reproduce yourself. Third, make
sure you evolve to higher levels, (spider -> flying insect -> dog [!],
or dog -> horse -> "human" [!]). The object of the game is to become
"human" (ie two legs, two arms, no wings :-).

It's fun. It's great. It's ECO!

- What is the address of Dreampark development?

A friend of mine has this installed in his STe and he loves it. I
think he told me he gets around *1.7* megs per disk. He also has an
Indus drive connected as drive B:, and that is real speedy as well;
he says you can see how fast it is because the track indicator
changes much quicker than before.

A look in ST Informer tells me that Dreampark's address is 1390 So.
1100 E. Suite 104, Salt Lake City, Utah 84105.

Um, gee, I just don't know what to say! I guess pointing out that most of us Amiga folks don't even know what you're talking about would be a good start, though.

There is much wisdom to be found in the new users posting... this situation is covered specifically. Always remember, when one person commits a transgression, posting a flame to a whole newsgroup is not only not constructive, it's downright rude. Two wrongs don't make a right, y'know...

As I have yet to see a MEGA/STE in the US yet, I have a question about the machine itself.

Those 13 pin anolog controlers that were added to the 1040ste, are they on the MEGA/STE? Just wondering

```
Vault and Dcache - Any news ???
------------------------------
A while ago I asked about some problems using VAULT while also
having DCACHE (harddisk cache) installed. The problem was
located inside DCACHE and the programmers (of VAULT and DCACHE)
talked and I got a message that a new version of DCACHE would
be made really soon....

Has anyone seen this new version of DCACHE ????
Does anyone know when and where I can get it (and at what price ?)
Does anyone have the email adresse to the author of DCACHE ?

1430. VCTRDEMO.PRG problem

Newsgroup: comp.sys.atari.st
Date: 1991-02-11 01:16:36 UTC
From: thaanuj@prism.CS.ORST.EDU
Message-ID: <1991Feb11.011636.14255@lynx.CS.ORST.EDU>
Source record: 234624

The other day somebody posted about the availability of VCTRDEMO.PRG at atari.archive (ekrimen perhaps?). I thought I'd give it a peek, but it doesn't seem to work correctly in either low or med resolution. It seems to be out of synch with the tv (Yes, I use a tv for color-only stuff and a SM 124 for everything else). It displays several shots of the demo, all flickering and jumping around the screen too much to really see anything.

Anybody else seen this? Advice?
(un?)relevant info: ancient 520ST, TOS 1.0, Internal RF modulator.
Thanks for any help.

John Thaanum thaanuj@prism.cs.orst.edu

1431. 1040 ST for sale

Newsgroup: comp.sys.atari.st
Date: 1991-02-11 01:25:03 UTC
From: bgr@uncle-bens.rice.edu
Message-ID: <1991Feb11.012503.1047@rice.edu>

This is my second post.
I am selling the following system:

Atari 1040 ST (1987 vintage)
1MB, TOS 1.0, 720K disk
Atari color monitor

All my software:
WordWriter ST
Zoomracks II
Alice Pascal
Dungeon Master
Assorted games (only good ones)
~200 disks of PD and Shareware,
including GNUemacs, Net Hack,
microemacs, STWriter, Gulam,
Sozobon C and much, much more.

All original manuals for HW and
commercial SW.

What the heck, I'll toss in the
eight disk storage cases, too.

All this for $575 o.b.r.o.
don't let this venerable system die
by becoming my dad's game machine.

If you buy the system, I will
also sell my Epson LQ800 with
tractor feed for $200.

Email to: bgr@owlnet.rice.edu
Phone: (713) 630 - 8715
Please leave a msg if I'm not there.

I have two 520ST CPU units for sale:

Unit 1 has 2.5 megs (Z-RAM upgrade) $300
Unit 2 has 1 meg (Piggyback RAM) $200

Units include mouse and power supply, and also have RF modulators built-in.
NOTE: These units do not include disk drives.

These prices are ASKING prices. If you want to haggle, go ahead! I love
a good barter session. If you have some hardware to trade, go ahead and
offer that as well. I'm looking for Atari ST and IBM equipment at the
present time.

If you are interested, just drop me a line at my signature address or call
me at (301) 455-1506 for the personal touch.

Thanks!

Chuck Rickard

I was recently in a class in which RFI, or EMI as they now call it, was the subject. During the class, the instructor claimed that EMI restrictions were tougher in European countries such as Germany than they are here in the USA. He also claimed that Canadian rules were essentially the same as in the USA except that there was more paperwork involved in the USA.

So my question -- is this constant delay for FCC approval a bogus excuse? If EMI standars are tougher in countries where new Atari equipment shows up first, shouldn't it be a cake walk to get FCC approval here? Having to re-engineer equipment to meet weaker standards seems unlikely :-)

I don't think that's the problem, as I've run the demo with all my
normal auto stuff and accessories and it works fine. The problem is
probably the fact that the demo uses a software overscan hack to put
graphics in the border. This is extremely tricky and requires perfect
synchronization with the monitor, something you're not likely to get
with an RF modulator and a TV set.

1444. status line in uniterm

Newsgroup: comp.sys.atari.st
Date: 1991-02-11 07:55:41 UTC
From: cliff@jarthur.Claremont.EDU
Message-ID: <10756@jarthur.Claremont.EDU>
Source record: 234643

How can I get a status line in Uniterm 2.0e?

I want to do this so I can run the sysline program on UNIX systems. I can set the number of rows on my terminal with the stty program (i.e to 23 rows which will leave an extra line at the bottom of the screen for the status line) but sysline still says I don't have status line capability even though I'm running in vt100 mode.

Any suggestions? Does anyone have any newer versions of Uniterm which fixes this?

Thanks for any help.

Ah, I just love my mail.

Look. I'm sorry if I haven't replied to your hate mail, all mail regarding Amiga users are trashed before I see it.

DON'T... bother cross posting to Atari. Frankly I could never see why Amiga users (and it has only been Amiga users) cross post to atari.st. To piss us off? Why don't we see Apple or IBM users bitch and moan about STs? At least they have class and keep to their own. Even I stay in atari.st. Has there been cross posts from Atari giving Amiga users shit? Why do I think not?

I am not apologizing, and those who would apologize for me, don't. I have nothing against other system users, just the little shits that bug me about mine, and it has ALWAYS been the Amiga users. I've NEVER seen a jerk cross post from Apple, IBM, or even Mindset computers.

I am only frustrated by those idiots that cross post to piss us off. They sound more and more like an anti-war protester at a Support the Troops rally.

>
>I don't understand the problem.

I do. I have about 8 different versions of LHARC they do not all use the same
letter for the same options. Some do not unpack lhz files with path names, some
do but not correctly. Some unpack in the current directory some unpack in de
root or lzh directory. Some understand UNIX style pathnames some don't

So the problem seems to be real to me!

May in a few days I will send a full list of incompatiblitys if I have time
to test all my version properly.

Perhaps it would be best if people actually look at what I wrote, rather than what they want to read into the message. Nowhere did I state (or suggest) that the file in question be REMOVED from the archive.

I do feel, however, that even computer games deserve some forms of comment. One does not turn off one's moral and ethical standards while sitting at the computer. I doubt that many people reading messages in this forum would have even THOUGHT about the stereotyping involved in games such as the file in question.

From the responses so far, I guess any condemnation of a computer game concept is equivalent to calling for the burning of books or the establishment of churches. I find it disturbing that people are unwilling to face the possible racism (or sexism) in a computer program.

Source record: 234709
Cross-posted to: comp.sys.atari.st,comp.sys.amiga.misc

Facts About European sales figures:
For France, where I live, ST sold better than Amigas till the end of 89, and now the figures have been reversed (amiga sold better than STs). Since mid-90, the amiga sales have raised tremendoulsy since the amiga 500 price went down to exactly the price of an ST. Prices of add-ons (memory, drives, etc..) were ridiculously high for the ami till last year when they drop to ST level, and even lower now.

I have read too that now in the UK that the amiga is the most installed (and the most sold I think) of ALL micros (including C64, etc...).

As for flame wars, I owned an ST and an amiga, and I would advise people to determine themselves by the software they want to run. The only "business" application I use is a videotex emulator, and no good ones exist on the ami, but very nice ones (ZZ-COMM) exist on the ST, I am planning to buy a ST-emulator on my ami to run it.
There are also very nice unix terminal emulators (term83) unavailable on the amiga, due to the nice mono screen of the ST.

But since now I mostly play games, the amiga is way ahead in this aera... so it all boils down to what you want to do with your computer.

```
Just a reminder, from the 'welcome to comp.sys.atari.st' monthly posting:

What sort of articles would interest people reading comp.sys.atari.st?
======================================================================

The most interesting articles are technical articles, impressions of
software/hardware, information on Atari user-groups and shows, or helpful
hints on how to make better use of the machine and its software.

The least interesting articles are in the form of 'my computer is better
^^^^^^^^^^^^^^^^^^^^^^^^^^
than...', especially when cross-posted outside of comp.sys.atari.st. If
^^
you don't know how to eliminate other newsgroups from a reply to an article
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
which is cross-posted, ask your systems administrator.

>Any info would be appreciated.

Look in the newsgroup comp.mail.maps for the particular map(s) for your area. In the U.S., should be something like u.usa.[your state].1, u.usa.[...].2 and so on. Figure out what to call your site, and keep it unique (you don't want your mail being sent to another site that has the same name!). Only the first 6 characters (I think) are significant, to make matters worse.

Using the map files, you should find a site close to yours and try to get a hold of the person or organization associated with it (each map entry has geographic as well as contact information), and ask them if they are willing to give you uucp access to their site. Hopefully, they will be acquainted with the details and will be able to supply you the correct information (number(s), password(s), etc...).

Some of the bigger sites might have enough traffic already (or another reason) so as to be unwilling to provide you a feed. I don't think this should be a problem in heavily populated areas -- plenty of sites to choose from. It may improve your chances of getting a feed if you, in turn, are willing to provide mail feeds to other sites.

Good Luck,

plini

I know that a version of lharc (for unix) exists at garbo.uwasa.fi (anon ftp),
and to me it seemed to be quite easy to port to any system. As far as I know
this program was made by a friend to the original author and should be
compatible with the (standard) msdos version .

>is eat a blade of grass here and there. I've concluded this is meant as a
>demo, not a playable game. If someone knows otherwise, I'd like to hear about
>it as well!

From the descriptions I've read of this it sounds very much like the game "Eco" that was released by Ocean back in 1988 ie it was a commercial product and sold for #20. However, it's now a very *old* game and I've not seen it around for ages so I suppose it's not impossible that it's been placed in the public domain since.

If I remember correctly (I sold the game to a friend ages ago) once you've eaten enough grass you should try to mate with another bug. If this is successful you get a chance to modify your DNA and evolve a bit. From their you can evolve into a dog or a bird and eventually into a human being. There's not a great deal to do and the game doesn't really *go* anywhere but it's just so surreal that I love(d) it.

Hmmm. Maybe it's about time I tried to get it *back* from the friend I sold it to...

1457. Undergraduate Summer Research Opportunity

Newsgroup: comp.sys.atari.st
Date: 1991-02-11 14:20:24 UTC
From: GIAMPAL@auvm.auvm.edu
Message-ID: <91042.092024GIAMPAL@auvm.auvm.edu>
Source record: 234702
Cross-posted to: comp.sys.next,comp.sys.atari.st

LOOKING FOR A KILLER SUMMER JOB OPPORTUNITY?
This may be it!

WHO: Any undergraduates who are American Citizens (no exceptions).

WHAT: A summer research program in Intelligent Systems, specifically, Expert Systems and Neural Networks. This is our 3'rd annual REU (Research Experience for Undergraduates) and is sponsored in part by the NSF.

WHEN: From June 2, 1991 until July 26, 1991

WHERE The American University CSIS Dept. in Washington, D.C.

HOW MUCH: YOU get a $2,000.00 stipend, plus FREE room and board.

That's the basics; here are the details :

Why?:
To be part of a team made up of faculty and undergraduate student researchers working in the area of Neural Nets and Expert Systems. The team will experiment with software development tools, design and implement software, and develop expert systems applications. You will have the chance to get your hands wet with some very interesting Neural Net research that is actively (and I do mean actively) going on here now. If you are motivated, this is a fantastic opportunity.

How will students be compensated?:
Student participants will receive a stipend of $2,000 plus FREE room and board (students must live on AU's campus). In addition, there will be opportunities to publish papers about the research carried on in this project.

Who is eligible?:
Currently enrolled sophmores and juniors who are American citizens are qualified. The American Citizen part is not optional - you HAVE to be an American citizen since this is a government funded project.

Participants must also be knowledgeable about Pascal. Some UNIX and 'C' experience is desirable as well as helpful. Essentially, you should be able to write reasonable sized programs (say >1000 lines), and be able to think independently.

How to apply:
Fill out the application form (Part I) and compose a "Personal Profile" (Part II). The profile should describe your career goals, projects you have worked on, subjects you enjoyed, and why and whether you are interested in teaching/research as a career. The Profile need not be longer than one page. Send the application and profile to:

Dr. Larry Medsker
Computer Science & Information Systems Department
The American University
4400 Massachusetts Avenue N.W.
Washington, D.C. 20016-8116

For additional information, contact :
Dr. Larry Medsker or Dr. Anita La Salle at
(202) 885-1470
(or e-mail to medsker@auvm.bitnet).
Fax # : (202) 885-3155

You can also e-mail the Application to : uunet!chopin!nick (me)

OTHER STUFF: I did this the first year it was held, and did support for last year's group. My honest feelings are that this an excellent program and that if you can, do it. This is the absolute best way for an undergrad to get a feel for what REAL research is like. It isn't taking classes, it IS research (read: they don't pamper or babysit you). If you are self-motivated and willing (and capable) of doing independant work, this is for you.

In response to all of the talk about amigas being 'true' multitasking machines and such, I just thought I'd point out that no matter how you slice it, a single microprocessor can only handle one command at a time. Depending on the methods you choose to do your application switching, you can buffer i/o and such to maximize your productivity, but you still are performing one function on the processor at any given clock tick.

Although I am relatively upset at the low priority given to midi and such musical applications on the net, I must agree with the amiga user that one of the main features of the st is its built in midi port and relative low cost, making it ideal for the struggling musician (like myself) but I must say that I have USED the 'big' sequencers on the mac, and I have toyed with amiga/ibm sequencers in the store, and none has come close to Notator on the ST. The ST is a wonderful machine for the price, and I was happy enough with my 1040st to upgrade to an STE (mainly for the blitter chip, tos 1.6, and memory upgrade, but what else is there?) I also just want to say that on the mac (I am running spectre by the way) I feel considerably more closed in. This is not a concrete term, but on the old apple][, I felt at home. On the ST, I feel at home. On the mac, I feel very restricted. I am not saying that the st is better...I don't think anybody needs to make that distinction. I prefer it.

As for multitasking, I hope atari does a system somewhat like multifinder on Mac because I love it.

see ya!

>BART service will no longer be available to access the Atari archive

This leaves us back where we were a few months ago. The panarthea archive isn't really an appropriate central depository of 'stuff'; that would impair its function as a newsgroup archive. As long as the enthusiasm and the resources exist at umich.edu, having a central repository there seems like a good idea. But ftp-only leaves a lot of us with pretty weak connections to it.

I have a couple of modest suggestions: In the IBM PC world, there's an ftp-only central repository at SIMTEL20. It is shadowed at (at least) 2 other sites, with mail servers at the shadow sites. There's a modest reduction in the disk load at the shadow sites because they can purge 'dead' files and re-fetch them only if needed. Traffic is decentralized. Any volunteers?

Another model is the UNIX/misc archives. Basically, they exist at 3 sites, with different access at each (although one of them, sir-alan, has been down for a rather long time). What they have in common, is that the requestor pays the phone bill. Anyone in a position to set up a bbs for the atari archive? A uucp-accessible site? Again, some degree of off-lining might be possible, although automating it might take a bit of effort. With both a bbs program and a uucp-clone having been distributed in this newsgroup, basic software availability should be a non-problem.

What all this requires is a couple hundred MB of disk, a cpu and at least one phone line. Ftp access would be desirable, but could be gotten around. The work involved would probably be too much for one person, but reasonable for 2 or more. Does either a shadow server or a second site sound like something someone wants to do? Any user group want to take on a BIG project? I suspect that a bbs with free and fee access levels could be kept from being a hopeless money-sink.

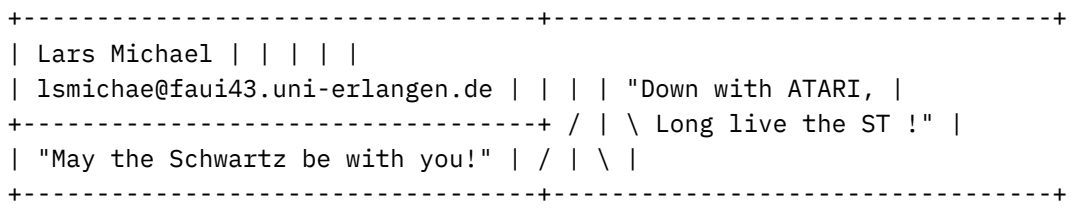
I really agree with you, *but* a multitasking system slices one second
so all non-blocked processes get one or more slices of time. This is
transparent for the user, so he may think he has *all* his processes
running.

Actually multitasking can help you e.g. in programming. Lets compare:

Monotasking:
You write some source with the editor, leave the editor, compile,
debug, find an error and start the editor again. Each application
has to be left before the next can run.

Multitasking:
Load all applications before use, and switch (without loading)
only to the one you wanna use. Indeed this is faster !



>Although I am relatively upset at the low priority given to midi and
>such musical applications on the net, I must agree with the amiga user

What else? The STE has:

hardware scrolling horizontal and vertical
four Joystick ports (plus two internal ports ?)
stereo digital sound
and some features which I don't know.

Lars

PS.:
I'm an enthusiastic ST-User.

I had problems with the demo (blocks of gibberish) until I put it on a
floppy and booted without the HD or any TSRs/ACCs.

It would seem to depend on what auto programs one is running....

>the flame war still goes on. Is there some way I can instruct my
>NETNEWS reader to say, filter out from comp.sys.atari.st all articles
>with the word 'Amiga' in them (and vice versa for Amiga readers)?
>

This only works for rn or trn newsreaders, so if you are using a vax or other
newsreader you will have to consult your manual.

While reading your newsgroup (comp.sys.atari.st for atari people,
comp.sys.amiga.misc for amiga people), type ^K (control-k).

This should start your news editor (set by the environment variable NFED
in your .login or .cshrc file - example for a csh user: one line in the
.cshrc will read, setenv NFED "emacs" , if you want to use emacs for your
news editor). The file you are editing is your kill file for the group
you are reading. If you want to eliminate postings that contain the word
"amiga" in the title then add this line:

/amiga/:j

If you want to eliminate the word atari then add this line:

/atari/:j

>

Well I'm not sure what you're doing but I've had no problems making copies of my disks. I had Falcon v1.1 and put both disks onto one (format at 880K) and use this to play as there are no disk swaps required. I've also made similar disks for the 2 missions (Counterstrike, Firefight). I used Mystic to format the disks and use a regular file copy to move the files. If you still have problems let me know.

That's where I got it. I believe it was in the utility directory. Look for
something like DLII024.ARC. Remember this will NOT work with >16 meg
partitiions.

1469. Local Atari User Group - ST meeting - Wed Feb 13/91

Newsgroup: comp.sys.atari.st
Date: 1991-02-11 17:13:22 UTC
From: daroloso@watmath.waterloo.edu
Message-ID: <1991Feb11.171322.28480@watmath.waterloo.edu>
Source record: 234707
Cross-posted to: uw.sys.atari,comp.sys.atari.st,comp.sys.atari.st.tech

At this month's ST meeting of KWEST:

1) An introduction to APL (available from our library).

2) Demonstration of Powermonger (from the makers of Populous) and 2
Spy vs. Spy games: The Island Caper and Arctic Antics.

3) Further examples of what can be done with Antic's Cyber Studio.

4) If we can get someone to bring midi cables, we will demo the new
shareware Midimaze II from Germany (also available from the library).

5) TWO (2) disks of the month plus the February issue of "The Hard Copy"
full of reviews and articles.

6) If you have any questions, problems, or new software, bring them along.

The Kitchener-Waterloo Eight Sixteen Thirty-two (KWEST) Atari user group,
has a separate 8-bit meeting and 16-bit meeting.
We meet monthly, have special interest groups (SIGs), associated bulletin
boards, public domain libraries, and a newsletter "The Hard Copy".

I am on the executive of the group
so I should be able to handle most questions or
get replies from the rest of executive.

The group welcomes new members and visitors with
8-bits, 16-bits, or those just curious.

Meetings held at the University of Waterloo in the
Math & Computer Building.

Rooms open at 7:00 pm. Meetings start at 7:30 pm.

Call 579-3695 for details.

Next Meetings
****

16-bit (ST) - Wednesday, Feb 13, 1991
DCS Course Room, Room 2009 (2nd floor)

Hope to see you there,
Dani Roloson

This is my first time posting to this newsgroup so hope it makes it!

Someone had posted about having Magic Sac for sale. I believe the person was Roger McClannen. I have attempted to send you email but again I am not sure if it will make it from my machine.

I am interested in purchasing it if you still have it. Please call or email me. Thanks,
Roger

Don't forget HP/Apollo, Unisys, NCR, Atari, Commodore, Force Computer, just to name a few. And both unit/dollar sales of 680x0 based products are much higher than the 88k lines.

There is no doubt 88k is superior than 680x0, but there are still large customer base sitting on 680x0 codes.

Disclaimer: Motorola doesn't know we have net access.

A couple of days ago I uploaded Spice, but because this is the first time,
I do any thing of the kind, I wanted to see if the thing got accepted...

SPICE.LZH : Yes the real thing (electornic circut simulator, version 2G5),
it can show some really impressive TTY-plots...
Remember to run the PRL program
before starting Spice itself.

If anybody have a newer/better port please let me know.

(I have some problems with this program, (can't start it) If you have the
same problem - _AND_ solve it, please let me know - thanks).

> instructions (in general).

Not only that, but I doubt the original claim. The 68040 comes pretty close to one instruction per cycle if you perform some instruction scheduling. It can almost certainly average under 2 clocks per instruction. Does the 88000 average under 1?

Anyhow, what counts is how fast an "equivalently equipped" computer with the two chips will run. A 25 Mhz 68040 can generate a SPEC rating of around 11, or more with an external cache. It cranks about 30,000 Dhrystones. Will a 25 MHz 88000 get over 20 SPECmarks or 60,000 Dhrystones?

>2. Motorola has only two REAL 680x0 customers left: Apple and Motorola. NeXT
> might pick up some slack, but not more than 2-3% in the foreseeable future.

I think you are forgetting the workstation market. HP (& Apollo) has a rather large market share (#2, behind Sun), almost entirely based on 680x0 workstations.

Another solution which would help nip these things in the bud, would
be if anyone who follows up to the posting uses the Followup: line to
redirect the discussion elsewhere. If everyone did this immediatly,these
stupid flame wars would die an early death.

In Dungeon Master 1 there is a room at the end of which is a diamond
edged sword in an alcove. As soon as you try and depart with it
the room fills with poison gas. The best I have done (even with dropping
everything) is to loose one character. I assume there are other
solutions to this. What are they ???

[various suggestions for allowing non-ftp'ers access to atari.archive deleted]

Your suggestions are good ones, Stephen, but they all sound like a lot
of work. Are you aware that there is a mail server at princeton
specifically set up to handle to remote ftp requests and send the
files to you by mail? Try sending the one-line message "help" to:

bitftp@pucc.princeton.edu

(Note: I haven't actually used this server, but I presume that it
works, since it's been around for a while. I think that there may be
similar servers located elsewhere, but I don't have addresses. Does
anyone else have any details on this sort of thing?)

Thats strange. I find Falcon to be one of the best flight simulators I own.
Sure it's protected, but that dosn't mean that it isn't a great game. I don't
find it's protection to be that much of a problem. You have to match up two
icons right after you load it. After that, the protection system leaves you
compleatly alone (Wish I could say that for the migs!).

I find that falcon extension #2 is the best. The enemy migs know have their
own missions (like bombing your own ground targets) and you have to stop them.
They don't just pop up and try to kill you. It has 3 types of aircrafts
(escorts, bombers, and Hinds). and each behaves like you would in their misson,
and not just like some computer was controling it.

Personaly, I hope the Spectrum Holobytes makes it big, they give good serviec,
sell at a resonable price, and know that to keep their customers happy they
need to keep making their products better.

> Sequent, Opus, and, of course, Motorola.

Call me biased, but I consider Hewlett Packard to be more *REAL* than any
of Data General, Tektronix, Sequent, Opus, or Motorola. Since you're
apparently not aware, HP does a pretty good business in Motorola 68k
workstations, partially through the aquisition of Apollo, and partially
through pre-existing HP products.

But of course, I'm not an official spokesman, and am just speaking of
my own opinions. I actually don't our official position on REALity.

1489. Music scoring and Tiger CUB

Newsgroup: comp.sys.atari.st
Date: 1991-02-11 21:57:11 UTC
From: rcd@cbnewsj.att.com
Message-ID: <1991Feb11.215711.13159@cbnewsj.att.com>
Source record: 234727

In my quest for reasonably priced MIDI packages that can output high-quality scores to the HP Deskjet, I was happy to come across Dr. T's Tiger Cub demo in STart magazine.

Having a sequencer, music editor, and scoring in one package at that price is pretty amazing.

Now, my question is, can the scoring program be used to add add lyrics (i.e., the words to the song) below the staff? If it can, I'm buying this package right away.

Oh, on the lighter side, does anyone know why the game "Powerdrome" is no longer available? The mail order places all say that Electronic Arts has discontinued it. Thanks,

Rana Dutt

From: warwick@batserver.cs.uq.oz.au
Message-ID: <7249@uqcspe.cs.uq.oz.au>
Source record: 234724

Due to overwhelming requests, I've now uploaded my latest version of STrabble (the game that is "cosmetically similar to Scrabble, but completely different, in that you can play against the computer").

This version runs in COLOUR or MONOCHROME, (Medium and High resolutions), but still requires 1 megabyte to run.

Again, if enough requests come in, I'll try to produce a smaller dictionary, but really, it is better with the full one. I used to run it with a 14000 word dictionary (now it is 45000), but the computer turns out too dumb.

Enjoy!
Warwick.

1492. UPLOAD: STrabble, NOTE...

Newsgroup: comp.sys.atari.st
Date: 1991-02-11 22:14:44 UTC
From: warwick@batserver.cs.uq.oz.au
Message-ID: <7251@uqcspe.cs.uq.oz.au>
Source record: 234726

Please note:

You will need ARC 6.0 to unpack STrabble.arc (It contains directories)
You probably already have this archiver, if not it is on atari.archive in the
archivers directory.

Sorry, I couldn't get LHARC to work (LHA121.LZH and LZH11316.LZH failed)At least now, all
the files will be in their own directories for you! (You might
want to create a "GAMES" directory as well though, for saving games - BTW you
can save games at the end too if you want, I do when I manage to beat the
computer on maximum difficulty, that's two games saved).

1494. Gemini for TOS 1.0

Newsgroup: comp.sys.atari.st
Date: 1991-02-11 22:59:27 UTC
From: tech002@ucsci.UCSC.EDU
Message-ID: <12184@darkstar.ucsc.edu>
Source record: 234728
Cross-posted to: comp.sys.next,comp.sys.atari.st

I was recently visiting a friend with a Mega 2 and he had the Gemini desktop installed on his computer. It seemed like a nice little Shareware program so I copied it from him because I wanted to run it on my 1040. It wouldn't work. Someone told me that it was because there was a problem with it running under TOS 1.0 (the author used some call nonexistant in the earlier TOS, or something) My question is if there is a version that will work and if so, where might I find it on the net (FTP)? Thank's for help.

Also, I would like to say thank you to everyone who helped me find a LHARC program for UNIX.

>
>Thanks.
>
>Paul Ricker PMR2@PSUVM.PSU.EDU

I use 'rn' to read usenet news, and if you wish to kill all articles that
have the word 'amiga' in the title, do the following:

while in the atari newsgroup,

Press control-k.
This will allow you to edit your kill file, type the following:

/amiga/j

This will junk all amiga titled messages.

I did this a few days ago, and it really is nice to skip all the garbage.

1497. gcc woes

Newsgroup: comp.sys.atari.st
Date: 1991-02-12 00:18:14 UTC
From: 4203_5132@uwovax.uwo.ca
Message-ID: <1991Feb11.191815.8575@uwovax.uwo.ca>
Source record: 234688

Now that I have my problems worked out with LaTeX...

I have been trying to get gcc 1.37.1 to run on my 1040 with a
megafile 30. I have the binaries in /gcc/bin, the includes in /gcc/include
and the libs in /gcc/lib. I believe I have the correct GNULIB and
GNUINC enviroment variables set correctly (from gulam). I am not sure
I have the GCCEXEC set correctly, in that I am not sure if it should be
a path or a prefix for the ld, as, cpp etc ,binaries. I also have TEMP
set to /tmp.

When I run gcc (on even the simplest c source), I get a cmd exit
code 1 from gulam, and no trace of a '.o' file. Seems however I can run
other binaries such as cpp and it has no problem working (finding the
include files etc.) What am I doing wrong? Could someone please e-mail
me the specifics, or a solution to my frustrating problem.

One last point. Where can I get a complete (LaTeX'able) set of
docs for gcc? Atari.Archive doesn't seem to have them, neither a few
other FTP sites. Thanks in advance...

This won't make the people in comp.specification very happy, indeed!

But seriously, is there a Modula compiler for the ST that has a
complete library of modules (and when I say complete, I mean all of the
ones named in Programming in Modula-2 by Wirth, specfically the lowlevel
interface and the multi-programming/resource sharing modules)?

Don't you just hate these programs with hard-coded language dependancies!
The whole purpose of a RSC file is to do away with such problems:
translating the language is trivial with resources. When I got GEMINI off
the archive, it was all in German. So I changed the resource, but still it
had some German stuff, because the authors had used form_alert type calls
with literal strings in them!

Oh well!
Warwick.

>
>Details!!!!!!
>
>please? anyone!!!!

about 6 months ago in the 'X' newsgroup there was a posting from a company
that was cloning the mac toolbox roms. In a recent housecleaning I
blew away the article, so I can't quote it. So go looking in the
X group for details.

memory tells me that they had something at the rough beta test stage, using
'X' (only just using X, not heavily depending on it) for the screen
interface.

Sorry I can't be more helpfull

Source record: 234733
Cross-posted to: comp.sys.atari.st,comp.sys.amiga

I am sorry for having to use a "form" type letter, but it
seems that the user mfolivo has achieved quite a " fan ;-) "
club in the past few days and many are quick to let me know.
I thank you for bringing this to my attention. I have a
strong suspicion that the user will be posting an apology
letter to the amiga and atari newsgroups, as I am sure that
the others involved will.
I am aware that we all have our off days, but that does not
validate flaming each other. The spirit of usenet is the sharing
of information with others. This is hopefully to be done with the
informative discussion of the strengths and weakness of each
computer system as pertaining to various applications.
Heated discussions are best dealt with via E-Mail, not public
ridicule.
I am not coming from the view point of the dreaded "NET POLICE"
as usenet is suppose to be an uncensored forum. I am not asking
for users on this system, or others, to fear censorship. What
I am asking is that users practice informative posting, not
emotional. The other reason is that I prefer to lead a fairly
quite life, as do most system administrators. Please, the next
time a flame war enzyme attacks the brain cells, resist the urge.
A copy of this letter will be send to all those who have written
me, the offending user on this system and posted to both the
amiga and atari groups.
Now maybe I can go back to sleep! :-)

1505. Uploading to Atari.archive and Comp.{Binaries,Sources}.atari.st

Newsgroup: comp.sys.atari.st
Date: 1991-02-12 03:23:32 UTC
From: weiner@terminator.cc.umich.edu
Message-ID: <1991Feb12.032332.12202@terminator.cc.umich.edu>
Source record: 234555

Uploading to Atari.archive.umich.edu
and
Posting to comp.{binaries,sources}.atari.st
By Jeff Weiner, Atari.archive Guardian

How to upload to atari.archive.umich.edu:

There are two main ways to upload to the archive: FTP or mail

1: FTP - This is the preferred method, as it doesn't clog my mailbox with megs and megs of stuff, not to mention it's a bit easier for you too. Logon to the archive as usual, then issue the following commands

```
cd ~atari/new
type binary
put filename.ext
mail weiner@atari.archive.umich.edu .... "Hey Jeff, I just uploaded this..."
```

This last step is very important. As we're now integrating the index with text and the ls -lR listing, descriptions and an address to send questions to are key.

2: MAIL - This is a bit slower for you and for me, but is still very effective. Simply uuencode the file, (please split it into parts ~=40 M or less please) and mail the result to weiner@atari.archive.umich.edu. Please name the parts in the subject line. This is really helpfull as the parts usually don't arrive in the proper sequence. Also, please include a message labeled file transmission, containing a short description of the file, etc. Shar files are also acceptable, but I prefer the uuencoded.

And for those of you who would like to see your binaries and sources appear in comp.{binaries,sources}.atari.st, the following is taken from Steve Grimm's Introduction to Binaries and Sources:

Subject: Submitting binaries for publication

Items intended for posting or queries and problem notes should be sent to atari-binaries@panarthea.ebay.sun.com. If you are on a UUCP-only site, you can send them to {backbone}!sun!ebay!panarthea!atari-binaries.

If you're in Europe, you can send binaries to the European submoderator, Jan-Hinrich Fessel, at unido!atari-binaries (or, if you're a masochist, atari-binaries@unido.informatik.uni-dortmund.de.) He will test them and forward them to me. Submitting to him saves net bandwidth, so it's encouraged.

If you want verification of arrival, so say in a cover note, or at the beginning of your submission, if it is small. I try to verify that a

program works, and if I can't get it to work, I may hold up posting it for a couple of days. Please note that, except in rare cases, software without documentation will not be published. The backlog from receipt to posting varies from one to four weeks depending mostly on the set of submissions currently in my queue.

If you are submitting both sources and binaries, PLEASE send the two separately. If I have to separate your sources from your binaries by hand, your submission will most likely sit on the back burner for a while.

Also, as of volume 8, I will only accept binaries packed with an archiver for which source code is widely available. For the time being, this pretty much means arc, zoo, and lharc. If you want to use a nifty new archiver, make the source code available to the public (posting to comp.sources.atari.st is fine.) I reserve the right to repack binaries with another archiver if the other archiver saves a significant amount of space, or has other advantages.

If you're submitting a demo of a commercial program, or a shareware program, please keep the amount of advertising to an absolute minimum. The net gods become angry when people try to use the net as a free advertising medium, and I'd like to keep comp.binaries.atari.st out of trouble. If you want to solicit orders, do it in a README file or an About... dialog box, not in a message that comes up every time the user does something. In other words, treat the net like a PBS station (apologies to those outside the US.) I will not accept programs which I feel are excessively commercial. I'm aware that commercial demos and shareware are often very useful (to the users on the net,) which is why I allow them at all.

Subject: Submitting source for publication

Items intended for posting or queries and problem notes should be sent to atari-sources@panarthea.ebay.sun.com. If you are on a UUCP-only site, you can send them to sun!ebay!panarthea!atari-sources. In Europe, send your submissions to Jan-Hinrich Fessel, the European submoderator of the group, at unido!atari-sources (or, if you're a masochist, atari-sources@unido.informatik.uni-dortmund.de.)

If you want verification of arrival, so say in a cover note, or at the beginning of your submission, if it is small. I try to verify that a program works, and if I can't get it to work, I may hold up posting it for a couple of days. Please note that, except in rare cases, source without documentation will not be published. The backlog from receipt to posting varies from one to four weeks depending mostly on the set of submissions currently in my queue.

I prefer that you submit sources and binaries separately, as it's a pain to separate them, and such submissions are invariably placed on the back burner. Sources should be submitted in the same format as binaries -- uuencoded arc, zoo, or lzh files. Please use Pierre Dumas' "uue" program if possible, as it can correct some common transmission

errors. Split long submissions up into reasonable (less than 50K)
chunks. "uue" will do this for you, if you use "uue -700 file" to
encode.

Please inform me of any special system requirements, and what development
environment was used, so that I can properly test your submission and
label it when I post it.

1509. FOR SALE

Newsgroup: comp.sys.atari.st
Date: 1991-02-12 05:01:09 UTC
From: chuj@spot.Colorado.EDU
Message-ID: <1991Feb12.050109.22819@csn.org>
Source record: 234730

I have the following Items for sale:

40 Meg HD (Miniscribe) ST506, I'm using it on a Adaptec 4070A
JUST the drive is for sale.

$160.00 (not including shipping)
(Will consider a trade for another ST machine)

122 Meg HD (MICROSCIENCE) ST506 28ms NEW for $475.00

2400 BAUD modem, Avatex modem. NO manuals.

$70.00 (This I will include shipping)

Single Sided 3 1/2 Drive internal came from the 520stfm

$35.00 ?

IBM LAPTOP Backlit LCD, carrying case, Battery.
It's the SPARK DATAVUE with 2 720k floppies
Click key, COLOR: DARK GRAY. 1200 MODEM,
DOS manuals, SOFTWARE: DOS, Turbo C 2.0.

$825.00 (shipping not included)

AND a local Denver Store has the following for sale for those
who are interested: (I know, I know this is atari newsgrp,
but for those who are about to upgrade to a new machine or
planning on purchasing. Consider this.)

386/33 Mhz 64k Cache, AMI BIOS, I/O PORTS
1 meg 80n (exp to 16meg on board)
FULL TOWER 6 Drive Bays, 230 WATT P/S
1.2 or 1.44 floppy drives.
122 Meg HD 28ms
1024x768 moniter .28 pitch with
PVGA 512k card (1024x768 16 colors) SUPER VGA
101 keyboard (7.5 MIPS and 58.7 Mhz AT speed)
ALL FOR $2150.00 + tax
Comes with 1 year warranty
Options: 9600/2400 FAX/MODEM send-receive grp 3 $170
4 megs $200 (or $70 each add.)
CO-PROCCESSOR CYRIX $500
ADD-LIB or SOUND BLASTER (6 voice - 8 voice) around $160
19 ms IDE instead of 28ms is $120
IF YOU ARE INTERESTED IN ANY OF THE ITEMS LEAVE ME E-MAIL.

By the way, I have recently kept up with the news, there seem to be a war that keeps getting worse. I have started to read the atari newsgrp for my st for new items and information not for comments on whose machine is better. I use to have an MAC+, and an AMIGA now I have an IBM and ST. I feel that the ST serves my educational purpose and the IBM serves the Business purpose. I got rid of the AMIGA and the MAC+ for reasons of the OS and other reasons as well. Oh well that is as far as I can go with this topic I hate flame wars about ATARI vs COMMODORE since the 8 bit years.

Jeff

1510. GEM programming book

Newsgroup: comp.sys.atari.st

Hello ST'ers,

I no longer own an ST, but...

I have a Programmer's Guide to GEM book (using C of course) that
has been living on my shelf for 3 years now. Hardly used, it covers programmingin GEM in
general, including on the IBM. Yours for $5, including shipping (
I figure after shipping, I'll make $2.15 or so for my trouble :-)).

Lemme know if you would like it.

> please? anyone!!!!

The following is an excerpt from the Minnesota Atari ST user group newsletter, which goes in the mail tomorrow (assuming I get the laser printing done).

THE LAST WORD

By Steve Yelvington

Well, somebody's finally done what should have been done a long time ago: written a genuine alternative Macintosh-compatible operating system. Not just a Mac emulator. A complete Mac replacement.

It's described in the Jan. 28 issue of InfoWorld, a weekly personal computer trade magazine.

A company called Nutek Computers Inc. has cooked up replacements for Mac ROMs and the disk-based portion of the Mac software (system and multitasking Multifinder). It also has three custom chips that can form the heart of a Mac-compatible, and it's looking for companies to produce the hardware.

This is different from Dave Small's Spectre, Magic Sac, AMAX and other Mac emulators for the Atari ST and the Amiga. They require you to track down a genuine Mac ROM chip set and a copy of Apple's system software.

Apple has suddenly clamped down on Mac ROM chips, and Apple dealers can get them only by turning in the old chips they're replacing -- or by paying a whopping surcharge. Apple seems determined to keep Spectre et al from catching up with current top-of-the-line Macs.

Nutek's technology sidesteps the whole problem by providing its own alternative software, developed in a ``clean room'' environment based on Apple's specifications without seeing a line of Apple's code.

And although it runs Mac software, it avoids ``look and feel'' copyright infringement by not looking like a Mac.

How can that be?

Well, Nutek has licensed the Motif user interface from the Open Software Foundation. OSF is pushing Motif as a friendly look for new Unix systems. IBM has adopted Motif for OS/2. And Geoworks has adopted Motif for GEOS on smaller PC clones. It's an attractive and well thought-out windowing system.

When a Mac application opens a window, it gets a Motif window. When it puts up a menu bar, it gets a Motif menu bar, attached to a window instead of glued to the top of the screen. This is actually easier to understand than Mac Multifinder's method of changing the content of the menu bar as you switch among concurrent applications.

I haven't seen any of Nutek's software running, but the pictures sure look good.

Dave Small has said he's not interested in making a Spectre that can use 256K Mac II ROMs, the current state of the art. One reason may be that they're darned near impossible to get. (There is a report that Apple is considering licensing Mac ROMs to other companies for $500 to $1,000 a pop).

If Nutek makes its alternative system technology available at a modest price, the whole picture may change.

(The rest of the column goes on to discuss TT and Apple pricing, and is therefore omitted here.)

1512. QuickST/TurboST revisited

Newsgroup: comp.sys.atari.st
Date: 1991-02-12 05:20:28 UTC
From: ekrimen@ecst.csuchico.edu
Message-ID: <1991Feb12.052028.26501@ecst.csuchico.edu>
Source record: 234750

Quick ST 2.2 came in the mail today (Thanks Frank!). I had heard it was faster than Turbo ST 1.8 which I have, so I wanted to give it a try. If this is old news, please forgive me.

Before I rebooted my machine to install Quick ST, I checked the benchmarks for TurboST 1.8 with Quick Index 1.8. I got the following for the monochrome desk accessory version (with TOS 1.6 blitter on and tons of stuff in the AUTO folder and DAs):

TOS Text: 299%
TOS String: 1257%
TOS Scroll: 103%
GEM Dialog: 233%

So I rebooted with QuickST monochrome version and got:

Loaded 4th or 5th in AUTO folder

TOS Text: 195%
TOS String: 670%
TOS Scroll: 101%
GEM Dialog: 224%

Loaded last in AUTO folder

TOS Text: 255%
TOS String: 675%
TOS Scroll: 101%
GEM Dialog: 248%

I was quite perplexed. Where was the overwhelming speed increase? I wondered if it was just one program slowing it down or what. One by one, I removed the TSRs and desk accessories and ran Quick Index each time to find out that it was the accumulation of all of them, not just one which slowed it down. With all of the stuff removed (the ICD booter doesn't make a difference), I got this from QuickST and Quick Index:

TOS Text: 303%
TOS String: 1241%
TOS Scroll: 103%
GEM Dialog: 264%

Therefore, QuickST HATES having stuff installed. Pity.

Just to be fair, I loaded the AUTO folder version of Turbo ST and here are the results:

with nothing else loaded

TOS Text: 302%
TOS String: 1282%
TOS Scroll: 105%
GEM Dialog: 244%

with all my usual stuff loaded

TOS Text: 228%
TOS String: 1225%
TOS Scroll: 103%
GEM Dialog: 227%

For those interested, I loaded both QuickST and TurboST (DA version)
and I got:

TOS Text: 296%
TOS String: 1257%
TOS Scroll: 103%
GEM Dialog: 236%

What was quite interesting was how QuickST blew TurboST away in the
BMVGTEFF benchmark. This one tests normal, bold, italic, light or
grayed, and underlined. The smaller figures are best.

TurboST had 67, 67, 274, 611, and 241.
QuickST had 48, 67, 58, 95, and 48.

I don't use bold, italic, light, and underlined stuff often, so this
isn't real beneficial for me. But QuickST really blew TST away in
this one!

Finally, here's what I have installed:

SUPERBT.PRG STENO.ACC
PINHED18.PRG STALKER.ACC
POOLFIX4.PRG TRBOMONO.ACC
CONS_FIX.PRG MYBUSY.ACC
NEOLOAD.PRG MOUSE28.ACC
FONTLOAD.PRG CALL_UIS.ACC
TIMESET.PRG
TRBO_RES.PRG
SKULL.PRG
WATCHER.PRG
NEWBELL.PRG
AUXINIT.PRG
FORMDIAL.PRG
BLUDTEST.PRG
MACCEL3.PRG
UIS_III.PRG
QUICKSTM.PRG

I'm surprised that QuickST didn't fair that well. Let's just hope
that QuickST III is good and that the upgrade fee isn't outrageous. :^)

Gee Mark,
You seem a little upset. Do you really mean what you said? By
the way; that wonderful post of yours was posted in the comp.sys.amiga AND the
comp.sys.atari.st groups. Are you telling the Amiga users to shutup and stay
out of thier own group. Who died and made you the net god? Just calm down and
get a tighter grip on your shorts, both hands Mark..... TIGHTER! [:^)=)
I have both Amiga's and Atari's; I would like to not have to read any
of these flames in either group. As an Atari user posts like that make the
rest of us Atari users look bad. On the other hand; some the pro-Amiga posts,
make us Amiga users look bad. No more! I mean it NO MORE! (doing my Jim
Belushi impersonation!). Bye.............

Luis

P.S. They're both fine machines! :)

This note is only moderately relevant to these newsgroups so I'll make it brief.

I've accepted a job in Pasadena, California, and will be leaving the University of Michigan after February 28th. While I will still be on the network somewhere, I will probably not be very active maintaining files on the atari.archive site any more. With any luck my STs will survive the move, however, and I'll still be working on ST stuff in my new location. (And bigger and better things too, of course!) Have fun...

Laugh it up, jerk. Can you do it? Why not use a third party if they can do
it better?
Being an Amiga-user does not give you the right to insult the name of Atari,
even that I kind of agree your opinion. I don't either have any right to
insult Amiga, and why to insult A GOOD MACHINE?

>Well, for me, and most Amiga users (if not all) multitasking blends right in.
>I couldn't stand a single-tasking machine, and thats one of the MANY reasons
>why I won't be caught dead owning a PC or Mac.

I wouldn't get a PC (486 & UNIX is an exception) either. Mac, maybe,
multifinder is good enough for me, and Mac definitely is poverful enough
for most of us! I would get myself a A3000, if it would not be so hell expen-
sive in here. (Finland) But NeXT and Sun and Atari TT ARE real competitors!

>Yes, but it costs. We get it FREE, and it works. WHERE it's made is no
>concern, unless you refer to the Soviet Union, where the public technological
>level is near zilch.

Free Amiga? Where? I want one now!!! Do not even mention Soviet Union here,
we have enough trouble because it being our neighbour...

>To actually display the video/sound doesn't require a fast CPU. Just lots and
>lots of RAM. The rendering, etc requires the RAM.

If we need RAM, we go and get RAM!

>Really? Neither the ST or Amiga is word processing machines, DTP, maybe but
>The ST's best DTP program is also out for the Amiga.

Calamus for Amiga? Then you definitely need better display than the standard
Amiga has...
Calamus for Amiga? Haven't heard such thing...

>When the '040's are available in mass quantities, an Amiga will eat a
>NeXT or SPARCstation I for lunch.

Well see about that! Amiga with 040 will be so expensive that it will never
be a real alternative... NeXT is very reasonable priced, it is cheaper than

A3000!!!
(If I get myself a NeXT here, it will cost about 18.000,- FIM. I can't
get a good-enough A3000 package under 23.000,- FIM...)

But take it from an evolutionary ecologist - it doesn't bear the
slightest resemblance to ecology. In fact, if I can get a copy, I
plan to use it to show my students a humorous example of pseudo-
science. And frankly, folks, any living organism is a "higher-level"
organism - only extinct organisms rank "lower" (is any point along
the circumference of a perfect sphere "farther" from the center than
any other? Does a sphere have a "top"? If not, then humans can't
claim any special status).

> I'm running in vt100 mode.

The problem is not with Uniterm but that sysline has looked at the
termcap entry for a vt100 and is complaining that it doesn't include
information on how to write to the status line (not surprising,
since vt100's don't have one).

What you need is a termcap entry that does support the status line.
Check out /etc/termcap on your system to see if it has a vt320 entry
and try if that works. In case you don't have one, I am appending one
to this message. It works fine with Uniterm. You either need to get
your system administrator to add it to /etc/termcap or else you can
set up a file containing it and then set up the environment variable
TERMCAP to point to it, e.g.
setenv TERMCAP /home/myname/termcap
In either case, you also need to set the TERM environment variable
to vt320, e.g.
setenv TERM vt320

(PC users may care to note that this also works very well with
MS-Kermit.)

Leila
------------------------ start of vt320 termcap entry -------------

Description: DEC vt320 termcap entry
#
Created by: composer@cs.bu.edu on 10 Feb 1990.
Last modified by: composer@cs.bu.edu on 20 Mar 1990.
Posted to USENET newsgroup comp.terminals on 15 Feb 1990.
Reposted to USENET newsgroup comp.terminals on 20 Mar 1990.

#
This vt320 termcap entry is a test entry for a vt320. (Imagine that? ;-)
It was written from scratch. All (well, at least, most :) of the
capabilities have been commented and should be approximately in the order
that they are in the entry. I took some educated guesses at some of
these, with info from the vt320 "Installing and Using .." manual and from

```
# some other termcap entries. I have yet to test the status line stuff, I
# will probably test it soon, though. Where I wasn't sure what to put for
# a capability, I added a comment of some sort. Also, the initialization
# string has comments about what each control sequence is supposed to do.
# If you have any comments or questions regarding this termcap entry, or if
# you see something I missed, please send me a note. Thanks...
#
# Enjoy!!
#
# -jeff
#
# p.s. Yeah, all these comments don't need to be included, but (who knows?)
# they might be useful for some of those out there that have not built a
# termcap entry before, or have forgotten. If any changes are made that I
# feel should be reposted, I will probably only post the main termcap entry
# with the comment for the `is' capability only. But, then...I dunno.. :)

I think the main expense concern is not the resource conversion, but
the cost of translating and printing the manuals. Anyone who has read the
Abacus books will know that it must be hard to find good computer-literate
translators, thus they probably charge a lot.

Roger.Sheppard@bbs.actrix.gen.nz writes:

I tried to reply to the base note via e-mail but it bounced. Since
the current discussion hasn't touched on all the point's I made, I'll
post it here.

Jim, I think you've been sold an old package here. The first
version of Falcon was double protected as you described, but over
a year ago they yeilded to complaints and removed the disk protection.
Actually, when you say "cannot be backed up by normal means",
do you mean copied by the desktop copier? If you do then you should
be aware that many disks nowadays use 10 sectors per track and can't
be backed up by the desktop. There are many pd programs around that
handle 10 sector tracks, and the extra disk space is often necessary
to fit the program onto the unfortunatly still standard single sided
disk.
So I suggest you try a ten sector copier, or if you have a double
sided disk drive, format a double sided 10 sector disk and copy both
disk's files to it. If this doesn't work, contact Spectrum Holobyte
and they will upgrade you to version 1.2 for a nominal fee. I've
found Spectrum Holobyte to be very responsive when talking to them
on GEnie.
Note, version 1.2 and the mission disks will run from the hard
drive, and also have more managable flight controls.
Also note. There are European import versions being sold here
which are heavily copy protected, and usually don't fly as well, as
S.H. usually puts extra time into flight controls after getting the
game from Rowan Software, who does the port.

> John Upham, (Chemical Physics Ph.D)

There is an easier solution, yes. Instead of grabbing the sword and running, just stay where you are. The first cloud will wear out, and you should still be alive. Cure up if you want to. Then, step forward one square, then back again. This will set off the next cloud, but you won't be in it. As they only trigger once each, you can repeat this down the corridor - set off the next could, then back out of it.

Peter.

1531. Number of bitplanes vs. number of colors (was Re: MegaSTe info)

Newsgroup: comp.sys.atari.st
Date: 1991-02-12 13:46:18 UTC
From: kentd@FtCollins.NCR.com
Message-ID: <KENTD.91Feb12134618@zappa.FtCollins.NCR.com>
Source record: 234471

<8305855@arium.stgt.sub.org> writes, RE: 640x400x2 :
> Well should mean 'two bitplanes' what gives a choise of 4 colours.
>
> TschauTschau
> Bernd

I'm pretty sure you're wrong, at least in the context of how the numbers were presented in the original article. To quote from the original post:

> <good stuff deleted... >
>
>
> What is also confusing is that the mono mode indicated in the manual
> says two colors are available on the MEGA STe, from a palette of 4096,
> at 640x400?! I of course can't test this as I only have the SM124
> to work on.
>
> < more good stuff deleted... >
>
> Graphics 320x200x16
> 640x200x4
> 640x400x2
>
> Color 4096 Colors

Proof: for 320x200 to have 16 bit planes the color pallette (sic) would have to be _at_least_ 65536.

So, to summarize: #of possible colors to choose from = 4096, X rez = 640, Y rez = 400, # of simultaneous colors for display on screen = 2

Sorry for the repost, to any who understood the first time, but I hate to see misinformation on the 'net. :^)

Thanks, to the original reviewer by the way!

1532. Re: Mega STE - Available in Canada, & some rumours

Newsgroup: comp.sys.atari.st
Date: 1991-02-12 13:50:07 UTC
From: art@maccs.dcss.mcmaster.ca
Message-ID: <27B7F290.23492@maccs.dcss.mcmaster.ca>
Source record: 234427

The Mega STE (4mb, 40mb hard disk) is in the store right
now, right here in Hamilton, Ontario, Canada. Selling for
$1900 or so Canadian Funds (plus applicable taxes)

This is not just a display model, they are actually selling them.

Latest Atari Rumours from my dealer:
- due to shakeups in Atari, he thinks that atari may start
shipping the mega-ste's in 1 meg, diskless configurations,
allowing the dealers to slip in 3rd party ram and disks.

- Even wilder rumour that atari might get together with a 3rd
party board manufacturer and put a PC (yes, MS-DOS) board
inside the mega-ste together with the Mega board, and continue
to sell them *AT*THE*SAME*PRICE*

Disclaimer: these are _rumours_ - I have heard nothing official

From article <1991Feb11.054514.25449@terminator.cc.umich.edu>, by
jon@terminator.cc.umich.edu (Jon Brode):
>
> Mr. Kaiser probably thought he was really clever when he figured out how
> to get around our quota system. Over the course of 4 days, he requested
> over 90 files totalling many megabytes. When this came to the attention of
> the atari.archive.umich.edu system administrator, he put an end to it.
> For good.
>

Mr. Kaiser's activities are to be deplored, that's for sure.

But is it not the also the case that the decision to close the service
completely just because of the activities of one abuser is an
over-reaction?

Now other people are being denied use of the service through no fault of
their own. Was there no easy way to fix things so that Mr. Kaiser was
denied but not others?

I don't want to overreact here myself. I appreciate that any access to
atari.archive is a privilege, and not a right. The people who run the
service contribute major efforts, voluntarily as far as I know, and it's
up to them how they want to run it. I hope that net users don't send
flames in the direction of umich.

But on behalf of the people who rely on the BART mail service, as I did
until fairly recently, could I ask that the decision be reconsidered?

In the meantime, if there are any UK users without FTP access who have
used BART and who want files (within the fairly tight limits of my quota
and the time restrictions of our scratch space), I'd be prepared to
fetch them here and then mail them on - provided it can be done quite
quickly, as I don't have time to go exploring on other people's behalf.

^^^^^^^^^^^^
Here's the culprit, Ed. When using QuickST, I discovered (after having received my NeoDesk 3 upgrade) that certain screen operations seemed to be slower than before. After some experimentation I discovered that it is the alternate Font program that causes the major slowdown (especially in the Text Scroll benchmark.)

Not having TurboST 1.8, I did not discover that it handles the alternate fonts better than QuickST. Hmm...

On a personal note: Gee, and I thought that I had a lot of AUTO folder programs! ;-)

> I'm surprised that QuickST didn't fair that well. Let's just hope

>world.
According to Electronic Engineering Times (Jan. 28, 1991, p. 10)
"Startup claims legal Mac-clone chip set", the company, Nutek Computers,
claims to have developed a "Mac-like OS" in a software "clean room",
that is, where the developers had no access to Apple code. The question
yet to be answered is whether or not their approach will actually
withstand a legal challenge.

In order to avoid the "look and feel" issue, the OS uses a Motif interface
instead of the Mac desktop.

There have been many complaints about BITFTP clogging up the net since it went into mail service--originally, it had a binary-only connection with BITNET nodes. Personally, I use bitftp, but NOT on Usenet, only on BITNET. If we overuse bitftp, it will probably disappear soon. So, use it, but check with your sysadmin and/or your feeds first, and use it responsibly.

1538. Can I use multisync monitor from PC on ST?

Newsgroup: comp.sys.atari.st
Date: 1991-02-12 16:08:28 UTC
From: leilabd@syma.sussex.ac.uk
Message-ID: <4486@syma.sussex.ac.uk>
Source record: 234660
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Sorry if this is a FAQ, but it's not a topic that has ever interested me before.

A colleague is planning to buy a hi-res multisync monitor for his pc and would like to know if he can also use it with an ST. Are there any particular characteristics it should have to be usable on both systems? Are there any particular questions he should ask the salesman?

Thanks,

Leila

As I read it, this is a startup company; and they hope to succeed.
Likely these Clean room designed roms will be released with the $500 TT. Ha!

Seriously, I am afraid that GBS is soon to be in big trouble.

I just got Branch Always' newsletter and the upgrade to QuickST 3.0 will be $15. It's supposed to be availble in June. I think the big change is they will have different loadable drivers depending on your hardware configuration (Blitter, TOS version, etc.). Also a new version of Quick Tools coming out.

Bob

I am the manager of the USENET and electronic mail gateway between Digital Equipment Corporation and the rest of USENET. The unfortunate incident for which Mr. Kaiser has been so cruelly blamed was completely an accident, and is the result of a "culture clash" rather than any malice. It is perhaps best not to use harsh words until you have finished understanding an incident.

Hans Kaiser works in Digital's software support office in Stuttgart, Germany. Like most Digital field offices, it is equipped with VMS computers and connected to Digital's DECNET network. The converstion between internal DECNET and external protocols is performed by the DECWRL computer for which I am responsible.

VMS and DECNET do not have the concept of queueing mail. When you send a message, either it is delivered instantly or it bounces. The idea is that you want the sender to know instantly if his message did not get through. As a result, VMS mail users have, through the years, grown accustomed to believing that if they do not get a "message sent" message, then their message did not get sent.

Whenever mail is relayed from one network to another, rather than just queued, the concept of "immediate delivery" is somewhat meaningless, because you haven't really delivered the mail, but rather have just handed it off to some intermediate postman. But user expectations are still very strong: if a user sends an internetwork message, and doesn't get back a "message sent" reply, his experience leads him to believe that the message was lost.

Last week we had a head crash on the primary disk on our DECWRL relay computer, and for various reasons it took almost 3 days to get the machine back up. We announced this failure on the appropriate internal Digital newsgroups (dec.mail.config), but did not send individual notification to the tens of thousands users of the gateway, as we sometimes do when we are certain that it will be down for a long time.

During this interval Hans Kaiser was trying to retrieve files from the Atari archive server. He is not a reader of dec.mail.config and probably did not know that the gateway was down. He sent some retrieval requests, and got no reply.

Here comes the "culture clash" that I mentioned in the first paragraph.

When a VMS user sends a mail message that does not get delivered, he is conditioned to believe that it has been lost or deleted, because that is what happens in the normal case. However, these messages that Kaiser sent were neither lost, nor deleted. They were carefully queued, waiting for the DECWRL gateway to come back up again, so that they could be sent.

When he got no response, Kaiser sent more requests. This is the natural thing to do in the VMS world. If it didn't work, and if you are following instructions, then try again. Maybe something will have been fixed. I don't know exactly how many times Kaiser repeated the request over the 3-day interval, but I am sure that if he had known that his messages were all being queued, instead of vanishing as he thought, that he would not have repeated them.

Eventually (I think it was on Wednesday night, California time) the DECWRL gateway was brought back to life, and all of the queued messages were sent to the Atari archive server in one lump. Archive servers are in general programmed to have per-user quotas, so that if something like this happens, it won't bring the archive server to its knees trying to handle so many requests at once.

Alas, here the "culture clash" strikes again.

The DECNET mail protocol does not support a "time and date" mechanism. The only information that it records about a message, besides the message body, is what we Unix/IP people know as the "To" and "Cc" and "Subject" and "From" fields.

In DECNET protocol it is up to the receiver of a message to timestamp it with the time that it was received. The reason for this is that since there is no queueing, the time that a message was received is guaranteed to be equal to the time that it was sent. As a result, the network mail protocol has no mechanism to record the time that a message was sent.

The documentation for the DECWRL mail gateway, which we distribute to all employees who ask for it, instructs them to use the gateway by sending mail with a certain mail program that is not part of the software that Digital ships to its customers. This program, called "nmail", is helpful in smoothing the peak load on the gateway by queueing at certain times. However, since the mail-sending software knows that the mail might be queued, it records the time that the message was actually originated. This is because the "Date" field in the message will contain the time that it was delivered and not the time that it was actually sent. "nmail" does this by adding the date and time to the "From" field of the message. It really doesn't have much choice, because the DECNET mail protocol supports only a "To", "Subj", "From", and "Cc" field, and there is a fixed limit to the size of the "Subj" field.

Why does this matter? It matters because the Atari archive server at the University of Michigan looks at the "From" field of an incoming message to avoid processing too many simultaneous requests from the same person. There is a "per-user" quota for each day. The problem is that when you send the mail using a mail program that encodes the date and time of the message in the "From" field, then every message looks like it came from a different user.

As a result of this, when the DECWRL mail relay came back to life last Wednesday, it sent many dozens of retrieval requests to Michigan all at once, and Michigan's software failed to understand that they were all from the same person because the "From" field on each of them had a different date and

time. As a result, the Michigan archive server tried to process all of them at once, and, evidently, melted into a pile of slag.

Since I work for a company that sells computers, I suppose the loyal thing for me to do at this point is to try to sell Michigan a bigger computer to use as the archive server, but I don't work in a sales office, I work in Corporate Research, and what I want is for everybody to be happy. I am very sorry that a combination of accidents inside Digital, in Germany and California, caused this unfortunate incident on a university computer at Michigan, and I will happily offer the services of the excellent network programmers at DEC Western Research to help ensure that the Michigan archive server does not meet this fate again. Mostly I want people to know that this was in no way the fault of Hans Kaiser. If it was anybody's fault, it was my fault, for accidentally failing to copy the serial number of a certain disk drive onto a service-contract renewal form for 1991, thereby leaving the disk unprotected by maintenance contract. Disks often fail on purpose when they learn that they are not covered by maintenance contract.

If you have sent Mr. Kaiser (or Herr Kaiser, as he probably prefers to be called) a nasty message, it might be civil to send him another one letting him know that, now that the facts are known, you aren't so angry any more. If you find the need to be angry at somebody, please be angry at me. As the manager of an electronic mail gateway, I'm used to it.

Brian Reid

It's getting closer to THAT time -- the dreaded need to upgrade. I'll avoid the IHDQ (Inevitable Hard Drive Question) and focus on the Meat and Potatoes.
So, being of weak skill (and will), I shall most definitely send the unit to someone more qualified. And I shall go for the whole 4 megs. (Boy, I never thought 1 Meg could be so small :-)) So that is not the contention. However, there is no point in having the unit cracked open without getting some other perks, like TOS > 1.2 . So, what's available. Can I (or will I) be able to get TOS 1.60? 1.62? 2.00? Any pratfalls (i.e., is there a bug-free 1.60 chip source)? And (gulp) how much is that going to cost? Who does it? Who does it WELL? Should I wait for TT (or does TT == Godot)? Your thoughts, O Wise One.

Also, on a related note: are there any plans to put NeoDesk 3 on cartridge? It seems SOMEBODY should be using that damn port, why not them?

For Sale:

Mega2 Atari with 20mb hard drive, colour and monochrome monitors,
Timeworks software, and assorted other goodies. Make an offer over
$750. I'm posting this for my Dad, who has finally seen the light
(no, no, no flames, please, he *really* would like to stay with Atari)
and purchased a 25mhz '386 VGA system. A word of warning to any
non-Atari folks reading this: there is very little support, and almost
NO service available for the Atari machines anymore. You will have
a great piece of hardware but you will be on your own.

Cheers,

This is a re-post with clarifications of my original article "Bye Bye BART".
The original has been cancelled.

The BART mail server is no longer available at atari.archive.umich.edu.
My understanding is that it is down for good, but I haven't had an
opportunity to really discuss it with the system administrator yet.
Perhaps he will permit it back with some additional patches to the
quota system. I don't know.

As for Herr Kaiser, he is directly responsible for the server being shut
down, but my characterizations of his actions as malicious were pre-mature.
Due to some unusual circumstances, some of which were very clearly explicated
by Brain Reid, it appears that I misjudged him initially. I have received
several messages from Hans apologizing for the trouble he caused and some
messages from his administrators backing him up. I apoligize for the harsh
words, it appears most of them were unjustified.

At this point, I don't know whether I believe his innocence or not. Even
taking the unusual circumstances into account, he was still using the
archive beyond the posted limits. However, I'm not in a position where
I'm able to ascertain his innocence or guilt so I will no longer pursue it.

Please stop sending him mail.

Below is my response to Brian Reid's article for those who are interested.

Jon Brode -- jon@atari.archive.umich.edu brode@math.lsa.umich.edu
University of Michigan, Atari archive manager

In article <1991Feb12.165927.21941@pa.dec.com> reid@wrl.dec.com (Brian Reid) writes:
>There is a "per-user" quota for each day. The problem is that when you send
>the mail using a mail program that encodes the date and time of the message
>in the "From" field, then every message looks like it came from a different
>user.

Exactly. We knew the quota system was unsohpisticated, but it should have
been sufficient to keep the average user in check. The problem of keeping
a hacker from abusing a totally automatic mail archive server is very
difficult, and perhaps impossible to solve for now.

>As a result, the Michigan archive server tried to process all of them
>at once, and, evidently, melted into a pile of slag.

Actually, we received them over the course of 4 days so it seemed like
he was sending them interactively. I probably would have been suspicious
of mail problems if all 93 messages has shown up within minutes of

each other.

>I will happily offer the services of the excellent network
>programmers at DEC Western Research to help ensure that the Michigan archive
>server does not meet this fate again.

Most appreciated. Perhaps you can share with me your thoughts on parsing
incoming From: lines so that everyone has to play by the rules.

>Mostly I want people to know that this was in no way the fault of Hans Kaiser.

I'm not sure I'd go that far, but my initial posting about the extent
and intent of the archive abuse were definitely in error.

>If you have sent Mr. Kaiser (or Herr Kaiser, as he probably prefers to be
>called) a nasty message, it might be civil to send him another one letting
>him know that, now that the facts are known, you aren't so angry any more.

I concur.

1552. START disk help needed

I have a need which I hope will not appear inapropriate.

I was a START subscriber (disk) for six months. The subscription ended in November '90. When I recieved the October issue, the late one, it was missing the disk. I called START and they sent me the November disk instead of the October disk. I called back explaining the problem and was told that they would send another disk.

I have yet to recieve the disk and I suppose that because I no longer subcribe I may never get it. What I would like to know is if someone on the net could make arrangements for me to get a copy from them. If not the whole disk at least the D.A.Brumleave programs. I have two young daughters who would appreciate it.

Thanks,
Randy Hosler

Yes, it does! But it took some work to get it going on a Mega/Ste. Here's the scoop... It looks like the program uses some pretty weird interrupts cause it wouldn't work with my normal env. Okay, I took out the .acc's. Almost worked, but now the colors are very off. Uninstalled my HD and ran it from floppy. Works fine. The final solution was to format a HD bypass disk (with DCFMT302) and put a low-rez inf and VCTRDEMO on it. Boot from that then run the program. Pretty cool stuff. It would be very nice to see the source code so that everyone could use the 3-d sprites... Although, based on something I worked on before, it's not at all difficult to come up with the routines to do everything. It's just blits... and a 3d lib...! and z-buffering of a sort... and ... :-) Sounds like a good first grahix project for Turbo-C and assembler!

Another weird thing about the Mega/Ste... When booting from floppy, it will NOT run what's in the auto folder and it ignores the [ALT] key totally (it's supposed to kill the HD boot process). Any response from Atari? Be nice to us developers!

Joe

schaper@pnet51.orb.mn.org (S Schaper) writes:

>[Make TOS 2.05 available for 'older' ST's]

It is possible for Atari to make an upgrade, for the older ST's - the only hardware required is 2 roms (128Kb x 8) and a new GLUE chip. The GLUE makes all the rom chip selects. The new GLUE should make chip selects in the 0xE0 range instead of the 0xFC range. (with 6 rom sockets of each 128Kb there should be 768Kb rom space - now say that there is no room for GDOS).

There is problems however... All the new Atari computers (STE,TT) have new hardware! (TOS 1.8 and NOT TOS 2.05).

Another problem is that Atari might not see the enougt potential sale in such an upgrade, to justify the development of a new GLUE, and yet another version of TOS.

1557. Bye, Bye, BART: the other side

Newsgroup: comp.sys.atari.st
Date: 1991-02-12 19:49:19 UTC
From: ncalvin@oracle.uucp
Message-ID: <1991Feb12.194919.25001@oracle.com>
Source record: 234589

Well, upon hearing of BART's demise, I fired off an angry and rather ill-considered letter to the malefactor. Surprise! He wrote back! I owe Mr. Hans Kaiser an apology, and I'm posting his reply to try to prevent other readers from making similar fools of themselves.

Received: 02-12-91 00:56 Sent: 02-12-91 00:55
From: Hans Kaiser, SWAS Stuttgart/Germany <MAILSEQ:kaiser@suosws.enet.dec.com>
To: ncalvin@us.oracle.com
Subject: RE: You total bozo!
Reply-To: MAILSEQ:kaiser@suosws.enet.dec.com

Dear Sir,

I understand you are quite angry, but you first should hear the story from my point of view:

I used the mail server for some time now with now trouble at all.
During the last two weeks I've sent some requests across the network but got no response at all. After some time I thought they're lost, so I resent them. Now it seems as if these mails were not lost but terribly delayed, so they came to the server within a time fram of hours or a few days.

-> I do not know why these mails were delayed! I'm not responsible for this!

-> I did not intentionally go around any restrictions or quotas! I do not know how these restrictions work! I'm not interested in going around them! I've sent out my requests as I did in the past!

I'm sorry if this caused you and other people a lot of trouble, but I used the server the same way I used it all the time before.

This has nothing to do with Digital products!

I hope this clarifies this a bit
-Hans Kaiser

Am I anyone? On the cover of Infoworld, dated Jan 28, 1991, lower right:
Story about how Nutek Computers is coming out with Mac clones based on their own ROMS, developed under cleanroom conditions (I hope everyone knows how that works...the people who code the ROMS never see Apple code, but the people who check compatibility have whatever they want). The other gimmick is that screen displays are equivalent rather than identical, and that some of the system software may be internally different in their machines.

1559. Mercury UUCP question: accepting calls

Newsgroup: comp.sys.atari.st
Date: 1991-02-12 20:18:25 UTC
From: apratt@atari.UUCP
Message-ID: <2833@atari.UUCP>
Source record: 234670

Is there a way to use the Mercury UUCP package to allow people to call your ST and get uucico as a shell? Does the uucico supplied with the package work in this mode? I *believe* the answer is no: the Mercury uucico gets parameters from an outside file and is probably dedicated to the role it plays. So the second question is, is there another uucico that can be glued into the Mercury package that works in both directions? I know the uupoll program, which calls uucico, would have to change to pass the parameters another way.

What I want to do is complete the package by having a UUCP site that can both call and be called.

I found that the Mercury package runs on my TT, but only if I use 24bit.prg, because (at least) the GFA Basic runtime isn't 32-bit clean. Also, it won't run under MiNT -- somebody's making a bad AES call, I think, and again it's in uucico, which carries around all the incompatibilities inherent in the GFA Basic runtime.

A reimplemented uucico would solve a lot of the problems. Is there one?

Having Falcon currently installed on my hard drive, I find you
statement a bit incredible. Now, I do have the latest version
of the software (the first release WAS floppy-protected), but
you can upgrade by sending in your disks with US$5 or so.
The codewheel is a COMPLETELY reasonable method of copy protection;
considering the amount of pirating of games that goes on with
ANY computer, I would be surprised if a company DIDN'T release
an unprotected game with a code wheel.

Egad! Spectrum Holobyte is one of the better games houses in
North America - why such harsh language? Because you bought
an old version of Falcon which was copy-protected?

Perhaps with the rumoured Mac OS clone coming soon at a dealer near you, Spectre will be saved. It seems to me that an intelligent company selling a cloned edition of the Mac ROMs would not halt their distribution to a paying customer (maybe GBS could even make the entire thing into a card and not bother with the cart!).

> in the US?

In the spirit that Commercial vendors aren't supposed to post ad's for themselves BUT users can post hardy recommendations (and I haven't gotten my commission check yet :-), here's an "Ad" for Turbo-C that people might be interested in:

Joe
-=-

From the folks @ Gribnif:

Borland's Turbo C 2.0 for the Atari ST

For those who don't know, Borland Germany has released a special version of their Turbo C compiler for the Atari ST. The entire compiler and its error messages are in English, with the on-line help and documentation in German. Currently there are no plans for a version with English documentation (though we keep asking).

Some of the features of the package include:

o Full K & R implementation with ANSI extensions.
o Integrated GEM based editing and compiling environment.
o Handles both Borland and DRI object file formats.
o Libraries for TOS, GEM, Line A, and Borland Graphics Interface functions.
o Project manager for efficient compilation of multiple sources.
o 68881/2 math co-processor libraries.
o Window based source level debugger which allows for stepping, break pointing, logging, and much more. (Package 2 only)
o Integrated Lint and Make.
o Robust macro assembler which can generate 68000 through 68030 compatible code with full co-processor support.
o Turbo fast compiling which generates very tight code.

When in Germany at the Atari Fair in Dusseldorf we worked out an agreement with Borland Germany. Under this agreement we would be able to order copies direct from them for programmers in the U.S. and Canada.

Two different packages are available:

Package1: $160.00

Turbo C 2.0
Compiler
Linker
Editor

[At this time, I think only Package2 is available... Joe]

Package2: $275.00

Turbo C 2.0
Compiler
Linker
Editor
Turbo Assembler
Turbo Debugger

To order, send a check or money order (drawn on a U.S. bank) for the correct amount along with $5 for shipping and handling to:

Attn: Turbo C Offer
Gribnif Software
P.O. Box 350
Hadley, MA 01035

Be sure to include your name, address, and daytime phone number. If you have any questions, please feel free to call us at (413) 584-7887 (also call to use a credit card). We will be keeping you posted on GEnie as to the status of the initial order. Pricing subject to change under extreme exchange rate fluctuations.

1567. 1.44M external floppy on ST?

Newsgroup: comp.sys.atari.st
Date: 1991-02-12 22:25:26 UTC
From: <>
Message-ID: <3575@ncrwat.Waterloo.NCR.COM>
Source record: 234472
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I think my last post must have landed in the bit-bucket... Oh
well... If all else fails, try again...

I've got an Atari ST (one of the old Nov.20/85 1040's) and just
bought a 1.44M floppy drive to attach as drive B:...

QUESTION ONE
Do you need to do anything special to get 1.44M out of it? I can't
seem to get it to read a HD disk... I've found a SW/PD formatter
called Diamond Format, which formats to 1.44M (or 1.6M if you use
more sectors than usual). It also seems to be a stand-alone portion
of a hard drive backup program. Do I need to find a special driver
or something? The drive works fine as a double density...

QUESTION TWO
Does anyone know where I could find a 14 pin DIN (ie, the ST's external
floppy drive port) plug adapter, that has a female 34-pin (ie, the
floppy drive's bus) port on the other end? Or am I doomed to building
one? Given the half-dozen or so 3rd party manufacturers of external
drives for the ST, a part like this HAS to exist, right?

Chris Herborth,
[Guest-posting with Brian Gamble, esq.]

Note from Brian Gamble:

Neither one of us knows much about these Atari news groups. Post replies as
you see fit, or EMail to me at the address below. I will see that Chris
gets any EMail promptly.

Thanks for your help

Source record: 234655

As you will recall, the last message I posted reported that the copy of Falcon I bought was copy protected. This turns out to be because I bought an "old stock" copy. The later distributions are not copy protected. I called Spectrum HoloBytes yesterday and they informed me that by returning the original disks to them, they will replace it with the latest version. So for the time being, I'm stuck with the manual. The current version of Falcon is not copy protected, but requires a "Code Wheel" to be used. This much will be quite satisfactory.

One thing I've been wondering is whether there's any news about STE based flight simulators that use proportional joysticks yet? This should be a major improvement in IO. Of course, there has been an analog joystick adapter for an RC flight simulator for a long time now, but that program and joystick system was very elaborate (based on a dual double gimbled joystick system in an Futaba RC transmitter box) and as such quite expensive. I've been considering buying that program and hardware kit so I can have access to a proportional joystick system with my current ST.

Why is it that everybody in the world thinks that a processor is obsolete when it's successor is announced or becomes available??? I mean, come on, the 68040 is such an expensive chip that developing a machine for it would be cost prohibitive. And if the 68030 were truly obsolete, then why are OTHER companies, i.e. NOT ATARI, still using them? (Apple, commodore, etc?) Finally, sure there are newer processors available, but have YOU, or anyone else for that matter, completely exhausted the utility and power of the lowly 68000??? Realistically, the 68030 is still a powerful chip, and it really is NOT obsolete. It is older than the 68040, but it surely hasn't been exhausted of its potential yet...

weiner@terminator.cc.umich.edu (Jeff Weiner) writes:

- How to upload to atari.archive.umich.edu:
-
- There are two main ways to upload to the archive: FTP or mail
-
- 1: FTP - This is the preferred method, as it doesn't clog my mailbox with
- megs and megs of stuff, not to mention it's a bit easier for you too.
- Logon to the archive as usual, then issue the following commands
-
- cd ~atari/new
- type binary
- put filename.ext
- mail weiner@atari.archive.umich.edu ....

Thanks for posting this, Jeff.

For those that may not know, may I add that, for aesthetic effects,
if you enter "hash," before you "put filename.ext" or "get
filename.ext," the ftp program will display a # for every 1024 bytes
sent or received. Actually, when you 'put' a file, it will display
bunch of # at once. Moreover, if you enter "bell," it will sound your
system bell when a function has completed. Finally, you can send and
receive a list of files using the "mput" and "mget" commands,
respectively, with a list of the files after the command.

Well, it was in one of the recent issues of <either> PCWeek <or> InfoWorld,
a very small article on page 1 or 2. I don't even remember the name of the
company, but they were tickled that they'd actually done it. At this time,
they're only gloating about the technical feat (of cloning the ROMs by
reverse engineering rather than electro-Xeroxing), and they don't have a
development plan yet. I think they said something like "six months" or
"next year." Perhaps if Dave Small is listening, he can add something...

From: scoile@gmuvax2.gmu.edu
Message-ID: <3446@gmuvax2.gmu.edu>
Source record: 234596

What is the maximum number of hard drives that can be chained together on a 1040ST (TOS 1.0)? Is there any problem with having different sized hard drives (e.g. 2 20meg and a 30meg)? Is there a ceiling on the amount of disk space TOS will recognize? Is the number of partitions limited only by the number of letters in the alphabet, or is there a TOS limit on the total number of HD partitions?

I was just reading some info on the TT package and I have to wonder:
Why are they shipping UNIX V.4? This is at least two generations behind the
last version I know of, which is at least a year old to boot. Is this going
to be like the TOS story, with three or four different versions floating
around, and patches following them like abandoned puppies? Someone at ATARI
want to pick up this thread? It took me forever to learn the current one, and
I sure am not in the mood to backpedal. Of course, this is all moot until they
keep the TT from broadcasting like WKRP... :-)

And while I'm at it (deja vu!), I just want to mention that the latest
edition of ATARI INTERFACE has a small comparison between bottom-line Casio and
Yamaha MIDI keyboards. The crux was:

Casio: 44-key full-sized keyboard. 4 polyphonic groups of the 16 available
channels (6,4,2,4 if memory serves), 30 sampled sounds (2 of which
are blah sound effects). $250.
Yamaha: 61-key undersized (eugh) keyboard, channels independent (I think), 100
sounds (not sampled, I think). $350.

This is from memory, so no flames. If I get one of these (fairly likely),
I'll keep you (snicker) posted.

1575. Delta Modul by Omega finally released!!!

Newsgroup: comp.sys.atari.st
Date: 1991-02-13 00:48:36 UTC
From: s37837k@saha.hut.fi
Message-ID: <1991Feb13.004836.24546@santra.uucp>
Source record: 234663

Someone surely remembers those articles I posted about Delta Modul.

I gave up hope to see it ever...

Today a letter from Germany arrived...

There was a brochure of the Delta Modul Accelerator & 386SX AT-emulator!
They said that they are ready for delivery immediately!!!

16MHz 68000 & 68881 with cache and 16MHz 80386SX & 80387 with cache on the
same board! And even a chanse to use AT-cards. A VGA-card works in both
ST and MS-DOS mode.

But if you are generally interested about it's specs, please followup!

Those who want info for ordering, use email only! This is not a commercial
newsgroup!

Not connected to Omega Computer systeme! Just a future customer.

Jartsu

Tell me why you have cache, folderfix, you state that you are using TOS 1.4 and the ICD booter, well Folderfix is not realy needed with TOS 1.4

TOS 1.4 will give you a warning if it runs out of memory, also the ICD booter has its own built in cache, I have also fould maccel3 very buggy, this was reported on Genie, for some resone would stuff up my DCshow There should also be the TOS 1.4 Fix and go have a look at UIS III, I could not live with out it, also deskmanager33 now has a batch mode, very nice, but its a pitty it does not have some of the nicer features of SuperBoot 6.0, have you tried this, but I do prefer deskmanager33...

Source record: 234656

Distribution:world
Followup-To:upgrade

Well you did not mention TOS 1.4, that is only the cheapest option you
have, was Quoted by Atari as $99 fitted, For Ram go for the J.R.Allen
Simm upgrade, there is a 68030 and a 16 MHZ upgrades by Dave Small, uses a
patched version of TOS 1.6, but that could cost you, but there is also the
16 MHZ upgrade by ICD, Iam in the same boat, so will go for TOS 1.4,
the J.R.Allen simm upgrade and the ICD Turbo, if this does this help,
gee you should have far more help over there than we do have here in
New Zealand, Why not contact Double Click, they are in your home town..

Turbo C.
Well from what I have read Gribnif sells it and has some kind of
support for it, there are other dealers in the US as well, some have
been posted here, its also claimed that Atari now use it as there
standard compiler.

There is also Lattice C5, from HiSoft, these two seem to be the best of the C
compilers for the Atari.

I don't know if this is the problem, but the version of patch.ttp that I have
is definitely sensitive to the difference between lines ending in ^J only
(UNIX style) and those ending in ^J^M (most ST editors, and the desktop).
I haven't characterized the EXACT behavior, but I get the best results
by putting both main file and patch into UNIX style before applying the
patch. Steve saj@chinet.chi.il.us

Source record: 234674

bdm@fabry.rice.edu (Brian D. Moore) writes:

- It's getting closer to THAT time -- the dreaded need to upgrade.
- I'll avoid the IHDQ (Inevitable Hard Drive Question) and focus on the
- Meat and Potatoes.

Sounds like fun -- upgrade time!!

- So, being of weak skill (and will),

Sounds like me: weak skill. :^)

- I shall most definitely send the unit to someone more qualified.
- And I shall go for the whole 4 megs. (Boy, I never thought 1 Meg
- could be so small :-)) So that is not the contention. However, there
- is no point in having the unit cracked open without getting some other
- perks, like TOS > 1.2 .

Sounds good. Rainbow TOS is definitely a must-have.

- So, what's available. Can I (or will I) be able to get TOS 1.60?
- 1.62? 2.00?

Not for a 520, 1040, or Mega.

- Any pratfalls (i.e., is there a bug-free 1.60 chip source)?
- And (gulp) how much is that going to cost? Who does it? Who does
- it WELL?

You can. Read on.

- Should I wait for TT (or does TT == Godot)?

I don't know what Godot is (someone send me e-mail), I think most
people on this net believe it will arrive. Hmmm, it's the middle of
February. Well, yes, we're still waiting, but it's coming (to the
U.S. that is) so we can actually purchase them at a mythical local
dealer.

- Your thoughts, O Wise One.

All righty. I say, and I think a few people on here can back me up
on this, if you you're in the upgrade mood, you should sell your
current ST, be it a 520 or 1040, and get an STe. (If you have a Mega,
you'll have to decide for yourself; or maybe someone here who's gone
Mega --> 1040STe can help you out.) STe's are going for around $599,
if not less. With SIMM prices relatively low ($40-50) you can have a
four meg STe for less than a thousand. Plus, you'd be getting TOS 1.6
(probably 1.62, but can't confirm -- anybody know if they're

installing 1.62 yet?), blitter, stereo sound, 4096-color palette, hardware scrolling, and don't forget those wonderful 15-pin analog joystick ports!

OK, now, the hot rumor going around is that by the end of the year, all STe's -- dunno if this includes MegaSTe's -- will have an AT-Speed installed in them. Someone (Mark Blackstad?) on the Fidonet ST echo says that Atari is trying to get away from the non-IBM-compatible problem is going to remedy it this way. He adds that he's going to wait until the end of the year to get his MegaSTe. :^) I bought my STe in July. I'm glad I bought it then because I've been able to enjoy it for half a year and it will keep pumping along. Having a faster CPU and detachable keyboard would be nice, so I'm looking towards a MegaSTe or TT, but will certainly wait until the smoke settles. I bought my STe so soon, it had the hard drive problem, so that was kind of a pain. I'd say now is the best time to get an STe. The prices have gone down, which indicates it probably won't go down again anytime soon. The MegaSTe and TT still seem to be at least a month away, and then give them a two or three months after that to settle in.

So, if you're dying for an upgrade, I recommend selling your ST and getting an STe.

- Also, on a related note: are there any plans to put NeoDesk 3
- on cartridge ? It seems SOMEBODY should be using that damn port, why
- not them?

I asked Dan Wilga about this last year and he said it would be too expensive and raise the cost of purchasing the program to somewhere over $100.

Naturally, there is one solution that is so easy it's almost
ridiculous - but I'l tell it to you all anyway. Pick up the sword,
turn around, AND THROW IT. A moment after you throw it, step forward
out of the cloud, walk up to the sword, pick it up, and repeat the
process. You should take no more than ten or twenty points from the
initial blast of poison, and you're out in moments, instead of waiting
for gas clouds to disperse. I can't believe I'm the only person who
ever figured this out...

Thanks to all those who responded to my request for advice and comparisons of the Amiga and Atari-ST. I received much useful and constructive information and opinion, and with little if any hint of evangelical fervour (only one person actually objected to me posting the request in the first place!). It's certainly provided me with enough to make a decision, although I think that political expediency prohibits me from discussing any decision in public :-)

I gather from some replies that com.sys.amiga has been reorganised - for some reason the control messages have never reached my site, all I have is comp.sys.amiga. I therefore apologise if this message (as with the original) is in the wrong group.

Thanks again

I have recently been offered a choice from the Hewlett packard printer range, at a ridiculously cheap price. However, I am unaware of the availability of good printer drivers for the Atari, especially for GDOS. I have looked around, and I can only find drivers for the various Deskjet variants, nothing for Laserjet,Quietjet,Thinkjet,Scanjet,Desk Writer or Paintjet, etc. If anyone has any drivers, or knows where I can find any, please reply. I'm especially interested in GDOS drivers for any of the above, to help me in making my selection.

DLII may work for you but be warned it is buggy. On my HD (20 MB) it crashed
once: it wouldn't stop and the progress indicator continued past all bounds.

So be warned: be sure to make a backup.

If it works (a lot of times) it is quite good. BTW: the author doesn't support
it (to me for obvious reasons).

I prefer SENTRY from Beckemeyer.

Tempus has never used RSC, I for one don't like them, but I have read in
some UK. Mags, that the English version will soon be out, and that was
some time back, may be these Mags get carried away, because it was
some years back that we where getting Adimens, then back in Oct, 1990
that Kumana was bringing it out, but still no sign of it, these Mags
where ST-User and ST-World, it seems that the Editors of the Mags
dream a lot, by the way a Sales pamphlet of the Mega here has pile of software
boxes show on the back page, there is a box for Adimends, is this just
a con from Atari ???

Can anyone out there give me an idea of US prices for 32k*8, 35ns EPROMs?
Any names and addresses of relevant companies would be welcome too.
They're about $200 apiece here!

Smaller ones could be used, but I'd like to keep the speed up...

Replies by email preferred, Thanks in advance,

Marcus Bointon.

1598. Review of Dr.T's Sequencers (long)

Newsgroup: comp.sys.atari.st
Date: 1991-02-13 13:41:15 UTC
From: whitcomb@aurs01.uucp
Message-ID: <59574@aurs01.UUCP>
Source record: 234528
Cross-posted to: comp.sys.atari.st,comp.music

Thanks for the requests to post this.

Dr.T sells an entire line of music software. Several of these programs may be loaded into the ST's memory at once if you have a master MPE (Multi Program Environment) program. The two master MPE modules that I have seen are KCS (Keyboard Controlled Sequencer) and Tiger Cub, which is a low priced sequencer/editor package (more on both of these sequencers later). Once either one of these sequencers is run, you may load up to eight MPE compatible programs if memory allows. (The newest version of KCS, OMEGA, claims that now ANY program may be loaded into MPE, but I have not personally verified this.) What this means to the musician is that you no longer have to exit your sequencer program when you want to load your patch editor or librarian. You can also have editors for each of your instruments loaded at once. When you enter an MPE module from KCS, it leaves all of the KCS settings intact until you return. Conversely, changing a sequence in one MPE module changes it in all...the sequencer data is shared.

Another nice benefit of MPE is that even non sequencer modules can use the sequencer data. A typical problem with a non MPE sequencer and patch editor is that you may have to go back and forth between the programs to get your sound just right. Say you had just sequenced a new horn line, but you aren't satisfied with your trumpet patch. So you exit your sequencer, load up your editor and change the trumpet patch. Unfortunately, the only way to hear the new patch in context is to load up the sequencer again, re-load the sequence you were working on (hoping that you remembered to save it!), and play the sequence. Pretty tedious, especially if you need to do this several times. With MPE, both programs stay resident in memory, so switching back and forth is quick and easy. Even better, X-or, Dr.T's universal editor/librarian program, lets you play the current cue loop in KCS without even having to switch back to KCS at all. You can stay in X-or, tweak your patch and listen to it in context as many times as you want without switching back.

KCS is a *very* powerful sequencing program. It allows you to sequence MIDI data in several ways, and then provides a full arsenal of editing tools. The sequencing mode that I do most of my work in is called Track mode. Track mode has been designed to operate much like a multi-track tape recorder (which is a more familiar interface to most musicians than a menu of sequencing options). It has record, play, fast forward, rewind, stop and pause buttons that act almost exactly like a tape

recorder. Each "track" of sequenced MIDI data has it's own line on the screen that defaults to indicating the MIDI channel, but may be edited to any label you like. When that track is sounding, a little note icon flashes next to the label. You can isolate or mute a track by clicking on the label. You can also erase the most recently recorded track, but you have to go back to the edit screen to erase any other track (gripe #1).

The cue loops are really nice. I don't know how many hours I've wasted running the tape on my reel to reel back to the right section to record over a bad part. And sometimes I was tempted to keep a mediocre solo because I wasn't sure I could do better. Now I just set a cue loop and play the part a few times (muting the new tracks as I record them), then listen to each one and decide which I want to keep. If you then want to insert the new segment into an existing track, you can either merge tracks or use the "punch in" feature. Once you've set a cue loop in KCS, you can access it from TIGER and X-or too. You can save up to six cue loops at a time.

There are *lots* more options on the track screen, and pull down menus make them fairly easy to execute. It is certainly possible to use only this screen and treat KCS as a software tape recorder and nothing else. But wait, there's more...

The Edit screen is one of the most powerful features in KCS, and it also seems to scare many people away from KCS. The reason is that this screen displays the MIDI data mostly numerically, which is foreign to most musicians. A scrolling window on the left half of the screen displays MIDI information for one track at a time. Data given includes event number, measure, step, event type, note, velocity, and duration. You may select groups of notes (or, more strictly speaking, events) with the mouse and perform several editing operations on them, such as pitch transposition, velocity or duration scaling or limiting, channel translation, etc. You may also perform cut and paste operations, which should be familiar to anyone who has used a word processor or text editor. Unfortunately, unless the timing of the first and last event is corrected relative to the new position of the section, you may end up with unexpected results. There are ways to work around this, but they are not obvious, and can be frustrating to use. Luckily, the Undo command may be used for most operations, and a Backup command stores the current contents of the buffers to a backup buffer so you can recover from multiple operations. You can also toggle between Undo or Backup copies and the current sequence to decide which sound better. Of course, you can also save your current work to disk at any time to be absolutely safe.

A much more intuitive editor is TIGER, which may be loaded into MPE (it is included in the KCS OMEGA package). Notes are displayed in a modified "piano roll" format, graphicly showing pitch, timing,

velocity and duration with nary a number in sight. Want to change a note's pitch? Pick up it's icon with the mouse and move it vertically. Change the timing? Slide the note horizontally. Change the duration? Stretch the note icon. Change the note's velocity? Alter the note's stem length. Great fun! Up to three tracks may displayed at once, and you have access to all the KCS cue points. Of course, changing a note in TIGER also changes it in KCS. My favorite feature of TIGER (which stand for The Interactive Graphic EditoR) is that you can draw MIDI controllers in real time with the mouse. This is especially nice for volume envelopes, pitch bends and tempo changes.

TIGER is nice to use when you want to hunt down a bad note...it lets you "see" the note, and change it with the mouse. You can also use the mouse to draw in new notes.

I find that TIGER is most useful for editing individual notes and controllers, while the KCS editor is better for moving segments around, although you can perform most of the operations in either, so it's mostly a matter of taste. My main problem with TIGER (gripe #2) is that the screen control commands are a tad cryptic, and I find I have to keep referring to the command sheet to keep the cursor from leaving the portion of the sequence I'm working on. Most of the screen commands in KCS and TIGER have keyboard equivilents, which must be memorized if you don't want to interrupt the musical flow by flipping through menus (or, gasp, the manual) to find a command.

KCS also includes what is called "Open Mode" sequencing, but I have never really gotten a handle on it. It is designed as a generalized sequencing mode, that allows you to start and stop sequenced segments as you wish, or even write sequences that start and stop other sequences, but I have always found it confusing...and I am a software engineer by trade! The new Song Editor is easier to use, as it allows you to graphicly link sequences together to create songs. It has virtually the same interface as TIGER, so you really don't need to learn a new set of commands to use it.

I use the Song Editor mostly for songs that I am writing as I sequence them. I'll sequence several segments, say a basic verse, chorus, and bridge, and then make copies of each and tinker with them, so each verse has it's own flavor. Then I'll call up the Song Editor and try several arrangements until I find one I like. You can link song segments sequentially, or overlap them, for some interesting effects. Also, if I decide to add another verse later, I just add in another segment. It's quick and painless. You can also chop segments up, if for instance you only want to insert a half verse. All of this is done graphically with the mouse, ala TIGER.

KCS includes a simple scoring program called Quickscore, but it is of limited usefulness. I suspect it is included as a teaser

to get you interested in Dr.T's professional scoring programs. Still, if you need a quick and dirty transcription, it's nice to have. Someone asked if Quickscore allows you to enter song lyrics beneath the notes. Sorry, it doesn't.

The other section of KCS that I have never ventured into is called Programmable Variations Generator (PVG). It allows the program to randomly alter sequences you create with KCS to add color or variety to repetitive sequences. The user can control the degree of randomness, and which parameters may be changed. I hope to get into this in the future (I plan to use it to "humanize" my drum parts"), but I have been having too much fun with the other features to mess with it yet.

I guess what I like the most about KCS, is that there are so many ways to skin the cat. I don't always write songs the same way, so why should I have to record them the same way? Dr. T doesn't force you to adopt any one method, and all of the options encourage you to experiment. It allows you to explore musical ideas in new ways, and that can really spur your creativity. The trick is not to let all of the options overwhelm you... bite off a little at a time and go with it.

Tiger Cub is Dr.T's entry level sequencer, and I played with a copy of it that was sold to me with my ST. It is basicly a slightly simplified version of TIGER with a limited track mode screen ("only" 15 tracks). I sequenced a rather complex song with it and was so impressed that I ran out and bought the TIGER package to use with KCS (it now comes bundled with KCS Omega). If you are just starting out with MIDI and want an affordable sequencer that you won't outgrow in a few months, look no further. Oh, yeah, you also get Quickscore with it.

One other MPE module that might be of interest to computer types, is called T-Basic. It is an interpreted Basic language that allows you complete access to all of the KCS arrays. This way, if there is some bizarre editing function you need that KCS doesn't provide, you can write it yourself. I find it's editor to be frustrating at times (no cut and paste or block functions), but this is a problem I have with most interpreted languages.

One thing it is hard to knock Dr.T's on is documentation and support. The manuals are well written and easy to get around, and most of the menu commands are self explanitory. Once you've finished the quick tutorials, you can dive right in. The customer service phones are manned by responsive, helpful people, and if you need to contact the wizards on-line, they are available through the Berkely BBS in Boston where you can also get minor upgrades, bug fixes and user uploaded programs and sequences. Demo versions of much of this software is also available.

Many folks have knocked Dr.T's for having copy protection on the disks. Happily, KCS Omega is NOT copy protected. Dr.T says they will see how this goes before removing copy protection on future versions of their other software.

There is lots to be said about X-or, the universal patch editor and librarian, but I will expound on it's virtues (and vices) another time if anyone wants to hear.

Overall, I am pleased with this system, and I have been able to create music with it that I couldn't have conceived of without it. It isn't the easiest thing to learn, but as a software engineer I know that there is always a trade-off between powerful features and ease of use. Personally, I'd rather have the features. Dr.T is constantly updating it's products, so I'm not worrying about outgrowing it.

MPE is also available on the Amiga, and Dr.T's also has software packages for the Mac and PC, but I don't know how similar these are to the ST versions.

I am not an employee of Dr.T's, blah blah blah, and to be fair, I haven't spent much time with other sequencers (but if anyone wants to send me a free copy of one I'll be glad to check it out for comparison :-)).

Anyone else out there have any favorite MIDI software? I'd like to see some postings of your opinions.

-Jonathan the verbose.

I would like to know which version of UNIX System V that you know of. As far as
I am aware, V.4 is the 'latest' version of UNIX from AT&T USL.

I'd just like to point out that it's a great program, and the copy protection
takes no more than a few seconds. The disks can be backed up with Procopy,
however I had to play with the write-protect notch inorder for it to load
properly.

> still dongle protected (ick!)? Does it support Postscript to disk yet?
> Also, it would be nice to hear from anybody else using notator, just to
> get ideas and such on using the program etc..

Kevin answered your specific questions; as someone who does have 3.0, I can try to answer about "new features" (note - I never saw a previous version, so I only know what's "new" by reading ads and talking to other users).

Page Preview mode: not as useful as it could be, because the full page is displayed in about a 3" x 5" area of screen, making it completely unreadable. However, this appears to be the best way to control the number of bars per line on a line-by-line basis - you set the default bars/line, and from within page preview you can adjust that on a line by line basis by simply clicking on a line. There are also P_USER events you can insert in the event list; perhaps this feature was available in previous versions as well. Page preview also lets you print an individual page without having to reset the start/end bars.

Adaptive groove: really cool, especially for jazz. This is a form of quantization in which you specify up to 8 possible qunatizations for a track, and give parameters to help Notator decide which quantization to apply to a given segment. For instance, my basic AG says to use swing eighths normally, but straight eighths or even dotted sixteenths for any given beat if I happen to play that beat that way. Use triplets only if I play 3 or more of them within the span of a beat, etc. Notator automiatically partitions the track into segments (according to parameters you give it - I use segment lenghts of half a beat, one beat, and two beats) and quantizes each segment separately. User grooves (available in previous versions) are available for use in AG's, too. A user groove is basically "quantize this track according to the contents of another track" - ie, don't round to the nearest sixteenth, but round to the nearest note in the other track.

Hyper Edit I haven't used much. Looks like what I think Dr. T's Tiger is - a modification of the matrix editor in which, rather than one column for each pitch, there is one row per "instrument" where you define what "instrument" is. One use is in drum tracks, where the correspondence will indeed be one instrument per pitch. Each instrument has its own name, and can be qunatized separately, so this is more flexible and powerful than the matrix editor. Or, you can assign MIDI volume, or tempo, to one instrument, and draw crescendi or tempo changes with the mouse.

Fonts: I don't know what Notator did before, but it can now read GDOS fonts for text, lyrics, chord symbols, bar numbers, and a few other things. 10, 12, and 18 point "Sans Serif" and Roman fonts are supplied. The fonts used for notes and other actual musical symbols (including, inexplicably, the dynamic markings

and "Fine"/"D.S." and other musical symbols with their own P_USER numbers) are not adjustable, so you can still basically print music in only two sizes.

> "Maturity is knowing when and where to act immature"
>
>
The TOS limit: 16 devices, of which 2 are the floppy drives.
This leaves 14 HD partitions which can be active at one time.

The 1040ST limit: At most 7 SCSI devices. Most of these support
2 Hard Drives, some 8. Subtract 1 SCSI device for the (usual) clock,
and you get 6, giving 12 to 48 drives maximum.

The Atari Hard disk driver, AHDI, only supports 1 HD on each SCSI device.

Thus TOS will access disk like devices as letters C thru P.

What they demonstrated was an X implementation of the ROMS User interface.
-Things like : open window; write; etc.
This allowed a user program for a MAC to run on X. But in no way did they
attempt to implement the MAC lower stuff.

Sorry.

>I want GAUNTLET II, and I don't know how to get it.
>Does anyone have one that they will part with? or
>Does anyone know a store that has one left?

>AAron@sun.soe.clarkson.edu

This game was released in one of those multi-game packs. I forget the name of the package and of the company selling it, but these things are frequently in the mail-order lists. I can check the box and post the important info later.
For now, I can tell you that it's in the set containing Gauntlet II, Outrun, 1943 (or is it 1942?) and Street Fighter (or something like that.)
I should tell you that this game has a curious flaw, or at least, my version did. The game comes on two disks. You boot the game with the first one, but switch them right before the game starts. The trouble is, it doesn't switch off the drive while asking, so you have to change disks with the drive running. This, however, is not the problem, but it may be related. My version of the game insists on creating a character in the fourth player slot, which can't be controlled without some sort of adapter. So, you have your character on the screen with this other character that doesn't move and shoots continuously. You can push him around the screen, and hope the bad guys get in his line of fire. If he dies, he comes right back.
The game didn't always do this, though. It didn't do it the first time I used the game, and it didn't do it for a little while after I got the drive re-aligned. I have no idea what the technical explanation is for this problem - I don't really think it's a software problem. If anyone out there has any ideas on what the problem is, and how to correct it, please let me know.

Source record: 234700

Just as an aside... A friend of mine told me he'd somehow managed to kill Lord Chaos (by accident) instead of caging him. I tried to duplicate this feat, but wasn't able to with any number of fireballs. (At this point, my 4 characters were all master level wizards, though I don't have any 6th level masters yet.) I could sit and lob 4 6th power fireballs a second, firing from each character, for about 8 rounds, run away and recharge, and do this again and again ad nauseam, with no apparent effect. I wonder if he's immune to fireballs, mebbe I should use those magic swords or something. Also, there's no such thing as an invincible character, I've decided. I jacked all my stats up to max, and even with multiple fire shields up, you can't make any mistakes fighting the dragon or demons, or you're toast.

Having read several case histories of the US methods and requirements,
a) the paperwork *is* almost enough to explain the differences...
b) there are some bizarre requirements which prevent applicants from successfully pre-testing their machines, requiring time-consuming rejection and reapplication. (E.g. the FCC can hang *anything* off the ports - at random?) It would be interesting to read similar accounts of the process from these other countries.

>
>Call me biased, but I consider Hewlett Packard to be more *REAL* than any
>of Data General, Tektronix, Sequent, Opus, or Motorola.

But to be fair, the shipments of all of the above "not Apple" products
probably don't add up to a tenth of the number of Macs, STs and Amigas
that go out the door. Workstations may get the trade-rag hype, but in
terms of volume consumption of 680x0s they're pretty small potatoes,
I'd guess. By that measure (volume==REAL), the original poster is right.
(Of course, I suppose "REAL" must have different meaning in 88k-land...)

>to hard while you are doing this, you might crash it!

You're really confused here. There is nothing in the ST hardware that
prevents it from multitasking. You can add various hooks into the ST
OS to allow pre-emptive multitasking. That's what MicroRTX does, or
MiNT, or MX2. All of these packages work, though they present varying
degrees of Unix-flavor. Contrary to your belief, this is real multitasking,
and all three of these programs maintain TOS compatibility. It's not
very thrilling on an 8MHz 68000, but it works.

The current version also loads from a hard drive. I'm glad you
found SH as resposive as the feedback you got suggested.
>
> One thing I've been wondering is whether there's any news
>about STE based flight simulators that use proportional joysticks
>yet?

Your only solution so far is the Mouse-Stick (or whatever it's
called) from Gravis. This is reported on GEnie to be excellant for
Falcon, and also works to replace your mouse.

1631. G-Print: GEM-based print formatting program

Newsgroup: comp.sys.atari.st
Date: 1991-02-13 23:17:04 UTC
From: stephen@oahu.cs.ucla.edu
Message-ID: <1991Feb13.231704.14580@cs.ucla.edu>
Source record: 234516

```
One-time announcement of a newly shipping product follows (demo available):
------------------------------------------------------------------------------

Announcing G-Print, the GEM-based print formatting program for the Atari ST.

G-Print, which is now shipping, reads files from ST Writer, Word Writer ST,
1st Word, and 1st Word Plus as well as straight ASCII files. It then prints
them with a variety of formatting options using GDOS printer drivers and fonts.

Here are _some_ of the things G-Print can do:

* multiple columns * multiple fonts * landscape format print
* title pages * rules and borders * saved configuration files
* run word processor * screen preview * "booklet" print
* microspace justification

G-Print also has the unique ability to remap special text effects so that
light print, say, can be printed as outlined or in a special font.

In its fully functional distribution, G-Print provides GDOS and an easy to use
installer program, but a demo version which requires GDOS and a printer driver
with fonts is available on atari.archive in the newitems directory under
gprntdmo.arc. The demo is fully functiona, but it prints "G-Print DEMO"
on every page.

For more information, send me e-mail or contact

I think by UNIX V.4 you mean SVR4 which is the STANDARD UNIX according to AT&T and Unix International (the OSF disagrees). This is something of a unified UNIX definition (Xenix, BSD, UNIX V, etc) and includes support for networking, real time and X window system. I'd like to hear about a binary standard for 68K based SVR4 (there's already one for Intel I think). This would allow running software on the TT that was not specifically developed for it (ie. it was developed for any 68K machine running SVR4).

Any news on 68K SVR4 ABI (Application Binary Interface)? Am I just dreaming here?

1634. Rodneys UUCP

Newsgroup: comp.sys.atari.st
Date: 1991-02-14 00:38:42 UTC
From: bridak@n6vbg.hamavnet.com
Message-ID: <1991Feb14.003843.92@n6vbg.hamavnet.com>
Source record: 234498

Hello, I have been having a problem with the Rodneys uucp package, that I hope someone can clear up for me. I've received the entire package, decompacted and set everything up correctly. When I poll my host, it logs in it goes through all the Shere=hostname Ssitename, ROK Pg Ug, but when it gets time to pass and sync up the window and packet sizes (inita, b and c) It just times-out and quites.

The hosts log files says something to the effect; 'protocal not supported', Which is probably why the init a/b/c procedure dies. Could this be because his uucico does not like the window/packet sizes I'm sending? I've tried windows of 3 and 7, and packets of 64 and 1024...

Any and all comment, words of encouragment, etc. will be greatly appreciated.

Net responce is fine or mail to:
bridak@n6vbg.hamavnet.com

>user sends an internetwork message, and doesn't get back a "message sent"
>reply, his experience leads him to believe that the message was lost.

Now the situation is becoming clear. I'm supposed to use a network like
that at work, and the experience is a real shock to a Unix-user like me
(I hope that isn't called a Unich!). When I send mail to Vancouver,
which is 5000 km and 4 time zones away, if my VMS system doesn't connect
it does not send the mail. No queuing! No wonder Herr K. got confused.

If there is a message in all of this, it is that before we flame
individuals in public and pillory them by name, we should send mail and
ask for an explanation. Something about a fair trial...

- > FONTLOAD.PRG CALL_UIS.ACC
- ^^^^^^^^^^^^
- Here's the culprit, Ed. When using QuickST, I discovered (after
- having received my NeoDesk 3 upgrade) that certain screen operations
- seemed to be slower than before. After some experimentation I
- discovered that it is the alternate Font program that causes the major
- slowdown (especially in the Text Scroll benchmark.)

Yes, I did notice that FONTLOAD did slow things down a lot, but a lot
of the others also accumulated to the slowdown.

- Not having TurboST 1.8, I did not discover that it handles the
- alternate fonts better than QuickST. Hmm...

I tested TurboST with nothing installed and got 303, 1291, 105, and
245 for the respective categories. Overall, TurboST seems to do a
better job than QuickST, with STuff installed or STuff not installed.

- On a personal note: Gee, and I thought that I had a lot of AUTO
- folder programs! ;-)

Yeah, I do have quite a few, don't I? :^) Well, who likes that
boring green desktop anyway. (BTW, what's the default color of the
MegaSTe/TT's desktop?) I'd have more stuff installed, like the
DIGISTUF files, but they don't run on the STe. :^(

- > I'm surprised that QuickST didn't fair that well. Let's just hope
- > that QuickST III is good and that the upgrade fee isn't outrageous. :^)
-
- My sentiments exactly. Did you receive the Branch Always newsletter?

I did, in fact, receive it, even before I got QuickST. I didn't read
it carefully. As someone pointed out, the upgrade fee is $15.

I think that between his responses and Brian Reid's posting it seems pretty unlikely that any malice was intended. Of course you are upset at losing your server -- we all are -- but having used VAXmail I can vouch for the plausibility of Kaiser's and Reid's explanations. Your accusations have caused a lot of grief for Kaiser and DEC, and your waffling about whether to accept their explanations is rubbing salt in a wound that seems to have suffered enough.

>Please stop sending him mail.

I concur. When I read your original posting I forwarded it to him with the header "Is this true?" and I received a gracious reply and copies of subsequent correspondence. My conclusion is that Herr Kaiser did not act with malice, and that he was not even overly negligent (a real guru might have avoided the problem, but it does not appear to be a really slovenly mistake).

Right now the problem is overly strict system administration at your end.

Bill

I know how to correct the "Extra Ghost Player" problem. This occurs when you have a printer attached to the printer port, ond it is either off or turned on but on-line. Solve the problem by turning the printer on and put it off-line. (This happens because the 4-player adapter plugs in to the printer port, and a real printer conflicts with the game's expectations of reading the port.) NOTE: I do not know how the game reacts if there is no printer attached.

I need help on level 3 of Imortal. I got all the way to the part
with the Trolls. I drop the knife and they kill each other, but
then, when I enter the next room, I get killed by two more Trolls.
I can't get the Troll bombs to work. And I can barely get to the potion for
strength. How do you get by the Trolls?

Dana S. Kaufman

Strange, I never had any problem with this trap, true my characters almost died getting out with the sword but that was more a problem of I couldn't seem to find the button to open the exit door when I reached it... I finally hacked a hole in it with an axe and stepped out into the clean air a little weaker for the experience. I guess my guys were tougher than the average Joe when I reached this level, fighting all those Ring Worms must of built up some stamina. Did anyone notice that your characters seemed to slow down and act sluggish?

Hello :-)

My friend and I have been trying to beat this game, and I think
that we've come to a stand-still... We have made it to the 4th level of
the game, the caves part, and have been stuck.

The docs say that you change the characters, but we haven't figured that
out either! If you could give me any help on this game, ANY HELP ON THIS
GAME, that would be HIGHLY Appreciated!!!

Thanks All!!

Dave Hanna, of Atari Microsystems Corp. writes:

>All I can say is, No, it's not a bogus excuse.

Dave... while we have your ear, could you go into a little about why it is that Atari seems to be having such problems with FCC type acceptance testing..? The FCC regulations should apply equally to all computer manufacturers, but while Apple, IBM, Commodore, and all the little clone companies seem to manage to comply without too many delays, it seems that every product Atari has designed in the last few years has had to go through many cycles of testing and redesign before they can be sold.

Could you comment on what you think may be the reasons for this..?

Provided the time for a task switch is small enough. If task switches
were done every 10 seconds (and there's no law saying you can't), the
user would notice. Make task switches every microsecond and again
the user notices something: a darn slow machine (due to overhead -- I'll
explain below).
